[Orthoptera.] When the male is mature it has wings half the length of the body, while those of the female are but rudimentary. It is nocturnal in its habits. Its appetite is omnivorous. It leaves an unpleasant smell on provisions which it has been unable to devour. ¶ *Le Petit Coco:* A name given in San Domingo to a tree, *Theophrasta Jussiæi*, from the pounded seeds of which bread is prepared.

cō′-cōa (1), *s.* [In Fr. *coco*, but Littré considers that the French word comes from the English one; Port. *coco*, probably a contraction of *macoco, macaco* = a kind of monkey, to the face of which the cocoa-nut, with the three scars upon one end of it, was thought to bear a resemblance.]

1. *Of the forms* cocoa *and* coco (but of these *coco* exists only in the compound *coco-nut, cocoa-nut*): The fruit of the palm described under 2. [Cocoa-nut.]

2. One of the best known and the most prized of all the palm-trees. It is the *Cocos nucifera* of botanists. [Cocos.] Its appropriate habitat is the coast of islands or continents, between 25° of Northern and the same parallel of Southern latitude; thus it abounds along the coasts of the South Sea Islands, of India, of South America, and other places. It is sometimes found inland, even to the elevation of 2,900 feet above the sea, but it does not abound or flourish away from the sea; thus while there are many millions of them along the sea-coast of India, considerable regions in the interior may be traversed without more than two or three cocoa-nuts being seen. The tree rises to the height of sixty to ninety feet. The stem is slender and marked by transverse rings, being the scars left by leaves now fallen. At Bombay and elsewhere the natives may be seen climbing up the cocoa-nut trees by means of those rings, and descending again with the fruit, their frail support against falling being a rope made into a large loop encircling their waist and the stem of the tree. Some palms have fan-shaped leaves, others are "feathery palm-trees." The cocoa-nut belongs to the latter category; its leaves, generally 12—15 in number, like gigantic ostrich-feathers, exist in a bunch or tuft at the summit of the unbranched stem. A tree produces about 80 or 100 nuts annually. The uses of the cocoa-nut tree are innumerable. For those of the

fruit, see COCOA-NUT. The juice which flows from its wounded spathes is called in India *toddy* (q.v.), and may be fermented into excellent wine, and an intoxicating liquor made from it, *arrack*. Or the sugar itself may be separated, when it is called Jaggery. The unexpanded terminal bud is a delicate article of food; the leaves are made into thatch for dwellings, or into baskets and buckets, or materials for fences, or as substitutes for paper to write on. The midrib of the leaves serves for oars: their ashes yield potash; and from the reticulated substance at their base a coarse kind of cloth is manufactured. The hard case of the stem is made into drums, besides being used in the construction of huts; the lower part is so hard as to take on a polish making it resemble agate. The root is sometimes masticated instead of the arecanut, and the fibres made in Brazil into small baskets. (*Lindley, &c.*)

"The dream is past; and thou hast found again
Thy *cocoas* and bananas, palms and yams,
And homestall thatched with leaves."
Cowper: Task, i. 640.

cocoa-nut, coco-nut, coker-nut, *s.*

1. *Ord. Lang., Bot., &c.*

(1) The fruit of the palm described under No. 2. The ovary contains three ovules, but two of these are uniformly abortive. They leave three scars on one end of the fruit, one of which is so soft that it may be pricked with a pin: from this the embryo comes. The other two are hard and impenetrable. Its use for food, and the delicious beverage it contains, are universally known. The fibres which surround the rind are made into a kind of cord, called coir-rope, which, from its elasticity and strength, is well adapted for cables. See also Cocoa-nut Oil.

(2) The tree furnishing the fruit. [COCOA (1), 2.]

"The most precious inheritance of a Singhalese is his ancestral garden of *coco-nuts*. . . . In a case which was decided in the district court of Galle, within a very short period, the subject in dispute was a claim to the 2,520th part of ten *coco-nut* trees."—*Tennent: Ceylon*, pt. vii., ch. ii.

2. *Chem.:* The colourless, slightly opalescent fluid contained in the interior of the seed of *Cocus nucifera* is called the milk. It consists of 91·5 per cent. of water, 0·46 protein, ·07 fat, 6·78 non-nitrogenous extractive matter, and 1·19 ash. The ash of the kernel of the cocoa-nut contains about 43° per cent of potash, 8° soda, 4·1 lime, 9° magnesia, 13·5 chlorine, 16·9 phosphoric acid, 5° sulphuric acid, and 0·5 of silicic acid.

Cocoa-nut oil:

Comm.: The fatty substance extracted from *Cocus nucifera*, &c. A whitish peculiar smelling fat, melting at 25°, and remaining liquid for some time. It easily turns rancid when exposed to the air, and consists chiefly of glycerides of caprylic acid, $C_7H_{15}COOH$, lauric acid, $C_{11}H_{23}CO{\cdot}OH$, myristic acid, $C_{13}H_{27}CO{\cdot}OH$, and palmitic acid, $C_{15}H_{31}CO{\cdot}OH$. It was formerly thought to contain cocinic acid, $C_{13}H_{28}O_2$, melting at 35°, but it has been found to be a mixture of lauric and myristic acid. Cocoa-nut fat is chiefly used in the manufacture of soap, the refuse of the nuts being formed into a cake for feeding cattle. Some of the fatty acids are said to be uncombined with glycerin. The more solid portion can be separated from the more liquid fats by pressure, and used for the manufacture of candles.

cocoa-plum, *s.* The name given in the West Indies to the fruit of *Chrysobalanus Icaco*.

cō′-cōa (2), *s.* [Corrupted from Spanish-American, &c. *cacao* (q.v.).]

Chem.: A beverage prepared from the roasted seeds of *Theobroma cacao*. Its chemical composition, according to Mr. Wanklyn, is as follows: Cocoa-butter 50 per cent., theobromin 1·5, starch 10°, albumen, fibrin, and gluten 18°, gum 8°, colouring matter 2·6, water 6°, ash 3·6, loss, &c., 0·3.

¶ Forms of cocoa are obtained at the shops as raw, roasted, and flaked nuts, and cocoa nibs. The introduction of the method of preparing these is attributed to Sir Hans Sloane. It is always prepared with other substances. The nibs are the purest form in which it is supplied to the public. Next come cocoa essence, cocoa extract, cocoatina, and chocolatine, which are the ground nibs deprived of half their fat. Then come flaked and rock cocoas, which are composed of cocoa, sugar, and arrowroot or sago. Lastly, we have the so-called soluble cocoas, which consist of 40 per cent. of ground cocoa, the remainder consisting of sugar and starch. These are sold under various names, such as homœopathic, Iceland moss, Maravilla cocoa, &c.

cocoa-butter, cacao-butter, *s.*

Chem.: A yellowish white fat, having the consistency of tallow, a weak chocolate odour, and agreeable taste. Sp. gr. ·0·96, melting point 30°C. Cod-liver oil was first recommended as a remedy for diseases of the lungs about the year 1833. Previous to that time, it had been used with much success in cases of chronic rheumatism. Its efficacy is ascribed by some to the presence of iodine and bromine, whilst others assert that it is due to the presence of a minute quantity of free phosphorus. Cod-liver oil is frequently adulterated with other fish-oils, especially shark-liver oil, but the latter can be easily recognised by its low specific gravity.

¶ (1) *Code Napoléon:*

Law: The name given to a code promulgated in France in 1804, originally under the name of Code Civile des Français, but altered to Code Napoléon when the first emperor of that name came to the French throne. The term is sometimes used in a more general sense.

(2) *Code of Justinian:* [Named after Justinian, who was born of obscure parentage in A.D. 482 or 483; became emperor at Constantinople in April, 527; by means of his able generals, Belisarius and Narses, added Italy and Africa to his empire, and died Nov. 15, 565.] A code of law drawn out under the auspices of the Emperor Justinian. In April, 529, was issued a compilation of useful laws or constitutions from Hadrian to Justinian. In December, 534, a revised code was published, and was accorded the force of law. It was called "Codex Justinianus repetitæ prælectionis." In December, 533, a commission, headed by the celebrated jurist, Trebonius, published an elaborate work called "Digestæ" (things digested) and "Pandectæ" (embracing all). This also received the force of law, and it was used to supersede the text-books of all old jurists. Just before the Digest appeared, there came first, by direction of Justinian, an abstract of the greater work. To this was given the name of "Institutiones" (Institutes). New laws subsequently enacted were published under the name of Novæ or Constitutiones Novellæ, or Authenticæ. They are often quoted as his "Novels," which word here must not be interpreted works of fiction. The expression "Code of Justinian," used in a general sense, comprehends the "Code" properly so called, the "Institutes," the "Digest," and the "Novels;" used in a more specific sense, it is confined to the first of these four. The Code of Justinian is a very essential part of the civil law.

cō-deï'-a, cō-deï'-na, cŏ-deïne, *s.* [From Gr. κώδεια (*kōdeia*) = a poppy head.]

Chem.: $C_{18}H_{21}NO_3$ or C_1-$H_{18}(CH_3)NO_3$, methyl morphine. An alkaloid obtained by digesting opium with warm water, precipitating the meconic acid with calcium chloride, and concentrating the filtrate; the hydrochlorates of morphine and codeine crystallize out first, and may be separated by treating their aqueous solution with ammonia, which precipitates the morphine; the liquid is then evaporated, and the codeine is precipitated by caustic potash, and recrystallised from ether; it forms colourless prisms when crystallised from water, which lose their water of crystallisation at 120°; the anhydrous alkaloid melts at 150°. Codeine is a tertiary monamine; heated with soda lime it gives off methylamine, $NH_2{\cdot}CH_3$, and trimethylamine, $N(CH_3)_3$. Codeine dissolves in concentrated sulphuric acid without colour, if the solution is warmed to 150°C.; a trace of molybdic acid turns it a dirty green colour, becoming blue; and a drop of nitric acid turns it a violet-red colour.

2. *Bibl. Criticism:* A manuscript of any portion of the New or of the Old Testament, especially of the former. The original manuscripts of the two Testaments have been lost, and there is little hope of their recovery. In our inability to obtain them for purposes of consultation, it is needful to fall back on other copies as few removes as possible from the original. When in copying the Scriptures the

ancient transcribers detected an error committed by some one of their predecessors, they did not simply erase it, but placed it as an erratum on the margin of their copy. As further transcriptions were made fresh errata were similarly noted, till at length the margin became greatly crowded. In attempting to restore the original text great value is attached to the acquisition of any manuscripts made in one of the earlier centuries, from the power it gives one of eliminating errata belonging to subsequent periods. Manuscripts are divided into two classes: *uncials*, written in capitals and with no spaces between the words [UNCIAL], and *cursives*, written more in conformity with modern practice. The line between them should be drawn about the tenth century. In this respect the modern Biblical critic has the advantage of his predecessors. When the New Testament was rendered into English for the authorised version of the Scriptures, the Greek text used, that of Erasmus and Robt. Stephens, was based on MSS. more modern than the tenth century. Now some of much earlier date are available, prominent among which are the five noted below.

Codex A (called also *Codex Alexandrinus*): The Alexandrian, or Alexandrine, MS. of the New Testament. A MS. sent by the Patriarch of Constantinople as a present to the English king Charles I., and believed to belong to the middle of the fifth century. A correct edition of it was printed in 1860.

Codex B (called also *Codex Vaticanus*): The Vatican codex, or MS.; so named because preserved in the Vatican. A very valuable MS., belonging, it is thought, to the middle of the fourth century, if not even older. It was discovered in the latter part of the fourteenth century, but was a long time withheld from the examination of scholars. It was only in 1868 that it became practically accessible by the publication of a facsimile.

Codex C: The Ephraem manuscript, so called because some of the compositions of Ephraem the Syrian had been written over it. [PALIMPSEST.] It is supposed to be dated at least as early in the fifth century as Codex A.

Codex D: The manuscript of Beza, called after this eminent reformer, who presented it to the University of Cambridge in 1581. It is supposed to belong to the sixth century.

Codex ℵ (*Aleph*) or *Codex Sinaiticus*: [The Sinaitic codex, or manuscript; so called because Tischendorf, its discoverer, obtained it from the monastery of St. Katherine on Mount Sinai. The year of the great acquisition was 1859.] A most valuable New Testament MS., dating, it is supposed, from the middle of the fourth century. It is believed that it may have been one of the fifty copies of the Bible executed under the superintendence of Eusebius, Bishop of Cæsarea, by order of the Emperor Constantine, in A.D. 331. An edition of it was published in 1865. In 1892 a palimpsest manuscript of the Syriac Gospels was discovered by Mrs. Lewis in the same monastery. When photographed and transcribed, it proved to be of the same type as the fifth century fragments hitherto known as the Cureton Gospels.

Botany:

1. A genus of plants, order Cinchonaceæ, tribe Coffeæ, family Psychotridæ. The corolla is tubular, with four or five spreading segments, the stamens coming from its throat, the berry succulent, with two cells, each with a single seed. About forty or fifty species are known, the majority from the Western hemisphere. *Coffea arabica* is the coffee tree or shrub. It is an evergreen, with oval, shining, sharp-pointed leaves, and five-cleft white fragrant corolla with projecting stamens; the berry is first red and then purple. Though called *arabica* and abundant in Arabia, yet it is said to have been brought at first from Abyssinia. Now it is cultivated in the West Indies, Bermuda, and the hotter parts of America, as well as in many parts of the East. [Coffee.]

2. *(Pl. Coffeæ):* A section of Cinchonaceæ, containing those whose ovary has only one or two seeds in each cell, whereas the Cinchoneæ proper have a many-seeded ovary.

cŏf'-feĕ, *** cŏf-fē',** *s.* & *a.* [Fr. & Sp. *café*; Ital. *caffè.* Corrupted from Arab. *kahwa* = coffee.]

A. *As subst.:* The ground roasted seeds of *Coffea arabica.* The seeds or beans are imported into this country chiefly from the East and West Indies, but the finest quality, Mocha coffee, comes from Arabia. In the raw state the beans are destitute of flavour, but on roasting, a peculiar brown oil, caffeine, is developed, and it is this body which gives to the coffee its characteristic aroma. The most valuable constituent of coffee is caffeine, $C_8H_{10}N_4O_2$, an alkaloid identical with the

alkaloid theine found in tea. In the roasted bean it never exceeds 1 per cent. Taken in moderation, coffee is one of the most wholesome beverages known. It assists digestion, exhilarates the spirits, and counteracts the tendency to sleep. Coffee was not known to the Greeks and Romans but has been used from time immemorial in Abyssinia and Ethiopia. In Arabia it is known to have been used in the 15th century and throughout Asia in the 16th. It is a native of Abyssinia, Arabia, and parts of Africa. It was brought to the West Indies in 1720, and its cultivation has spread into Brazil and other parts of Central and South America. The annual production at present in various countries is: Africa, 36,000 tons; Brazil, 333,000 tons; Ceylon, 53,000 tons; Java, 90,000 tons; Manilla, 35,000 tons; West Indies, 42,000 tons; with considerable quantities in some of the Central American States, Venezuela, &c. Chicory and other substances are often used as substitutes, or adulterations. None of these substitutes contains any substance analogous to the alkaloid caffeine found in coffee. In fact their only use appears to be to give the coffee infusion a greater depth of colour. The sale of a mixture of coffee and chicory, or any substitute for chicory, is perfectly legal, provided such mixture is properly labelled. It is only when a mixture is sold as pure coffee that any admixture becomes an adulteration. Any of these substitutes when mixed with coffee can be readily identified by means of the microscope, even when present in very small quantity. (*W. Harkness, Esq., F.C.S.*)

¶ Coffins were in use in Egypt at a remote period of antiquity. The embalmed body of Joseph was laid in one (Gen. l. 26). This is the only mention made of coffins in the bible; what were in use among the Jews were biers (2 Sam. iii. 31, Luke vii. 14.) Some of the Egyptian coffins were wood. There were fine sarcophagi of stone, some of which all covered with hieroglyphics are conspicuous objects in the Egyptian room of the British Museum. There were coffins of baked clay in Mesopotamia. Cedar was used in Athens for enclosing the remains of heroes, and marble and stone among the Romans. But among the classical nations the later practice at least was to burn the dead and deposit the ashes in an urn. Burial has been nearly always the practice in the British Isles, and what may be generally called a coffin has existed from the remotest time, its early form being a stone cist, while its later one is too well known to require description.

"Thus far we have dealt with reasoning which has for its fundamental ideas, coextension, coexistence, and connature; and which proceeds by establishing *cointension* in degree, between relations connate in kind. ... The words Tense, Tension, Intense, Intension, are already in use. Intension being synonymous with Intensity, *cointension* will be synonymous with *cointensity*; and is here used instead of it to express the parallelism with *coextension*. The propriety of calling relations more or less intense, according to the contrast between their terms, will perhaps not be at first sight apparent. All quantitative relations, however, save those of equality, involving the idea of contrast—the relation of 5 : 1 being called greater than the relation of 2 : 1, because the contrast between 5 and 1 is greater than the contrast between 2 and 1—and contrast being habitually spoken of as strong or weak; as forcible, as intense; the word Intension seems the only available one to express the degree of any relation as distinguished from its kind. And *cointension* is consequently here chosen, to indicate the equality of relations in respect of the contrast between their terms."—*Herbert Spencer: Principles of Psychology*, p. 117.

Bot.: A tribe of Melanthaceæ, type Colchicum (q.v.).

cŏl'-çhĭ-çēine, *s.* [Lat. *colchic(um),* e connective, and Eng. &c. suff. *-ine.*]

Chem.: $C_{17}H_{19}NO_5$. An organic substance isomeric with colchicine, obtained by boiling colchicine with baryta water, or with dilute sulphuric acid. It is obtained in colourless plates, melting at 155°, by recrystallisation from alcohol. Colchiceine is soluble in chloroform, alcohol and boiling water. Strong nitric acid gives a yellow colour with colchiceine, which turns violet, then again yellow; if the violet solution is diluted with water and soda added, an orange-red colour is produced; ferric chloride gives a green colour. Concentrated sulphuric acid dissolves colchiceine, forming an intense yellow solution; by the addition of a drop of nitric acid it turns violet.

cŏl'-çhĭ-çĭne, *s.* [Lat. *colchic(um),* and Eng. suff. *-ine* (*Chem.*).]

Chem.: $C_{17}H_{19}NO_5$. An alkaloid which occurs in all parts of the plant *Colchicum autumnale.* Colchicine is an amorphous yellowish-white, bitter, very poisonous powder, which melts at 140° and is soluble in chloroform, water, and in alcohol; when dissolved in dilute acids or alkalies, the solutions turn yellow. Tannin appears to be the best antidote to this poison. It gives a white precipitate with mercuric chloride.

cŏl'-çhĭ-cŭm, *s.* [Lat. *colchicum;* Gr. κολχικόν (*kolchikon*). From the country anciently called *Colchis,* east of the Euxine (Black Sea), where it was said to grow abundantly.]

1. *Bot.:* A genus of plants, order Melanthaceæ. The perianth is tubular, and very long, rising from a spathe, the limb campanulate, 6-partite, petaloid, the capsule 3-celled, with the cells united at the base. *C. autumnale,* the Meadow Saffron (not to be confused with *Crocus sativus,* the saffron of the dye), is found in meadows and pastures. The leaves and fruit attract little attention in spring when they are in perfection; both wither before the summer is far advanced. The flowers, on the contrary, which are pale-purple, flourish from August to October. To a superficial observer the plant looks a crocus, and in fact it has received the erroneous name of autumnal crocus; but it has six stamens, while the crocus genus has but three. The corms of the Meadow Saffron are poisonous, but much use has been made of them in medicine. [Colchicum corm, Colchicine.]

COLCHICUM.
1. Plant in flower.
2. Leaves and fruit.
3. Styles and ovary.
4. Single fruit.

2. *Pharm.:* For the pharmaceutical uses of the Meadow Saffron, see Colchicum corm. *Colchicum variegatum* is found along the

Mediterranean. Its corms constituted the "hermodactyls" of the Arabs used to soothe pains in the joints.

colchicum corm.

Pharm: *Colchici cormus*, the fresh corm of *Colchicum autumnale*, or Common Meadow Saffron, which is collected about the end of June, and stripped of its coat, sliced transversely, and dried at 150° F. The fresh corm is about the size of a chestnut flattened where it has an undeveloped bud. The dried slices are about a line thick, firm, flat, and amylaceous. The taste is bitter and acrid. Used to make extract, an acetic extract, and *Vinum colchici*. According to Garrod, Colchicum increases the flow of the bile, and diminishes the heart's action; it possesses the power of controlling the pain and inflammation in cases of gout. The seeds, *Colchici semina*, are used to form a tincture which has the same medicinal properties. They are hard, reddish brown, spherical seeds about the size of mustard-seeds.

cŏl'-cŏ-thar, *s.* [Low Lat. *calcothar vitrioli*; a word of Arabic origin, and introduced by Paracelsus.]

Chem.: Red oxide of iron, ferric oxide, Fe_2O_3. A reddish-brown powder obtained when ferrous sulphate is distilled for Nordhausen sulphuric acid; it remains in the retorts. It is used as a red pigment, and is employed to polish glass, and when finely divided by jewellers is known under the name of rouge. It is sometimes called *Croccus Martis*, and was called *caput mortuum vitrioli* by the alchemists.

1. *Sing.* (*of both forms*): A coleopterous insect, a beetle.

2. *Pl.* (*of the form* coleopteran): An English term for the order Coleoptera (q.v.).

cŏl-ĕ-ŏp'-tĕr-ą, *s. pl.* [Gr. κολεόπτερα (*koleoptera*), nom. pl. of κολεόπτερος (*koleopteros*) = sheath-winged: κολεός (*koleos*), κολεόν (*koleon*) = a sheath, a scabbard, and πτερόν (*pteron*) = a feather, . . . a bird's wing, a wing, from πτέσθαι (*ptesthai*), aor. infin. of πέτομαι (*petomai*) = to fly.]

1. *Entom.:* The name given by Aristotle, followed by all modern naturalists, to a great order of Insects, characterised by the possession of "sheathed wings." Of the four wings which the Coleoptera, like the other more highly organised insects, as a rule possess, the lower, *i.e.* the hinder pair, are membranous, and so large that when not in use they require to be folded both longitudinally and transversely. The anterior wings, which are horny or leathery in texture, are much smaller, and folding over the others, protect them as a sheath does the sword or other instrument which it contains; hence the name Coleoptera (Sheath, or Sheathed-wings). [See etym.] The head has mandibles which move horizontally for biting purposes. It possesses in addition all the accompaniments and appendages of a mandibulate mouth. [Mandibulata.] The segments of the thorax are clearly separated, the prothorax bearing the first pair of legs, whilst the mesothorax and the metathorax (see these words) sustain the two other pairs, with the elytra and wings. The metamorphosis is complete, the larvæ consisting generally of grubs with six genuine legs, and sometimes anal prolegs, the latter suggestive of the similar limbs in an ordinary caterpillar. The Coleoptera are popularly known as beetles, but everything popularly called a beetle is not a coleopterous insect. [Blatta, Cockroach.]

The Beetle order is, in the recent period, the most numerous of any, it being believed that not less than 100,000 species exist; nor has it as yet been proved to have been otherwise in geologic times. The basis of most classifications of the Coleoptera is that of Latreille, who made his principle of division the apparent joints in the tarsi, the following being the sections, in ascending order:—

Section I. Trimera: Tarsi apparently with three joints.

Section II. Tetramera: Tarsi apparently with four joints.

Section III. Heteromera: The first two pairs of tarsi with five joints, the remaining pair with four.

Section IV. Pentamera: All the tarsi with five joints.

Mr. Stephens divided them into six sections: (1) Adephaga, (2) Chilognathomorpha, (3) Helminthomorpha, (4) Anoplurimorpha, (5) Heteromera, (6) Brachelytra.

Swainson arranged them in five tribes, viz., Lamellicornes, Predatores, Malacodermes, Monilicornes, and Capricornes.

The Coleoptera pass into the Orthoptera by means of the Earwigs (Forficulidæ), which by some are placed within the latter order, whilst Kirby and others elevated them into an order of their own, Dermaptera (q.v.).

2. *Palæont.:* The oldest known coleopterous insects are from the Carboniferous formation. They have been called Curculioides [Curculio], and Troxites [Trox], but whether the affinities thus suggested are correct is as yet doubtful. In the Lias and Oolite, beetles are more numerous. Many also have been found in the Tertiary, chiefly in the Miocene and Pliocene beds. (*Nicholson.*)

A. *As substantive:*

1. *Med.:* A disease of which the primary seat is apparently the colon, and which is characterised by severe but remittent pain of the bowels with obstinate constipation, but unattended by fever. The abdominal pain is allayed by pressure, showing that it is not inflammation of the normal kind, this being, as a rule, increased by pressure. Vomiting is generally present, as is also flatus. Sydenham called the disease belly-ache. It arises from various causes, specially from spasm, obstruction, over-distension, or inverted action. One notable variety of it is known as Devonshire colic, painters' colic, and plumbers' colic. It arises from the action of lead on the human body. In medical Latin it is termed *Colica Pictonum, i.e.* the colic of the Pictones, an old tribe existing in Roman times near Poitiers or Poictou, where a severe epidemic of the form of colic produced by lead once prevailed.

2. Universities came into existence before colleges, and the original state of things may still be seen in Scotland, where the immense mass of students reside where they like. The practice of living in common is only now beginning to creep in. Nevertheless, the word college has long been used in that country in connection with the Universities, though in a vague sense. In America also the words university and college are not well discriminated. In England, on the contrary, the two words are very precisely distinguished. It is thought that colleges first arose in connection with the University of Paris about A.D. 1110 or 1215, and that from France they spread to England. Mr. Mark Pattison was of opinion that the motive and design of college foundations in connection with the English Universities may be divided chronologically into three periods. In the first of these—the 13th century—the motive was purely academical. A college was an eleemosynary institute designed to collect indigent students into a house and provide them with two meals a day whilst they attended the university exercises. Of this type the original statutes of Balliol College, Oxford, offer a pure specimen. In the second period, of which New College, Oxford, may be taken as the most developed form, the early motive is still present, but the statutes now imply a rule of life. The colleges of this type are modelled on the best precedents of the monastic institutions, only that instead of making contemplation or evangelisation the motive for associating into a community, it is the cultivation of knowledge which is made the business of life. In the third period, that of the Renaissance, learning stands out as the supreme object of the founders. Of this type Corpus Christi, A.D. 1516, and Cardinal College, now Christ Church, A.D. 1525, are typical examples. (*Mark Pattison: Acad. Organisation*, 1868.)

Till lately all members of the two older English Universities were required to belong to a college; now there are a number of students unattached. University College, King's College, &c., are affiliated to the London University, which, however, is an examining and not a teaching body; it therefore grants its degrees to anyone of merit enough to receive them, careless whether he obtained his knowledge at a college or not. Colleges for women have been recently built at several English and American Universities.

A college consists first of a head, sometimes called by that name, in other cases designated a Provost, a Master, a Rector, a Principal, or a Warden. Next in dignity follow Fellows of the college and Scholars of the college: generally these are students as well. The teaching afforded by the colleges at Oxford and Cambridge is provided by the Tutors, who appoint Lecturers with the sanction of the head of the College. The law of the college is that expressed in the will of the Founder, and some one generally possesses visitatorial powers to see that such regulations are carried out.

Prior to the Reformation the clergy regarded the colleges of Oxford, Cambridge, and other Universities as clerical corporations; the right of visitation was therefore claimed by the ordinary of the diocese. Blackstone, however, states that now they are legally viewed as civil corporations. In the United States College is often confused with University, the titles being applied somewhat indiscriminately. The Universities of Harvard and Yale, for instance, are commonly called Colleges, while many Colleges are entitled Universities.

Entom.: A name proposed, in 1872, by Sir John Lubbock for one of two orders into which he divided the wingless insects, called by Latreille, Thysanura. For the other order the latter name was retained. They have a semi-masticatory or suctorial mouth, the first abdominal segment furnished with a ventral tube or suctorial organ, the last abdominal segment but one with an apparatus for leaping. They are popularly called Spring-tails. They constitute small leaping insects found in numbers when one shakes a bough over a pocket-handkerchief, or sweeps bushes with a hand-net. Sir John Lubbock divides the Collembola into the following six families: (1) Paniriidæ, (2) Smynthuridæ, (3) Degeeriadæ, (4) Podu.ridæ, (5) Lipuridæ, (6) Anouridæ, leaving under the restricted order Thysanura, the following three: (1) Japygidæ, (2) Campodeidæ, (3) Lepismidæ. The Collembola are virtually identical with the old genus Podura and the Thysanura with Lepisma.

2. *Palæont.:* Sir John Lubbock believes that the Collembola very nearly present the original form of insects, though he seems to agree with M. Brauer and Mr. Darwin that Campodea, which is ranked not under the Collembola but under the Thysanura, was the original stock whence all insects sprung, the reason being that various organs are generalized in it, which in the higher insects have become specialized, and the form of the little creature reappears again and again among the larvæ of the higher insects. He has, therefore, devoted a whole volume, with fine plates, to a description of the order. (*Sir John Lubbock: Monograph of the Collembola and Thysanura; Ray Society, London*, 1873.)

cŏl-lō'-dĭ-ō, pref. [Collodion.]

¶ *Colodio-chloride Process:*

Photog.: A photographic printing process invented by George H. Simpson, editor of the *Photographic News*, about 1863. It consists in holding in suspension a precipitate of chloride of silver in collodion, which is flowed upon glass or paper—in a manner similar to preparing a plate for the negative process—and dried in the dark. The sensitive surface so produced blackens on exposure to light, and will consequently give a picture under a photographic negative. An excess of free nitrate of silver is necessary to impart sensitiveness; an addition of citric acid and other organic substances is used to produce the desired tints. After exposure the picture is fixed and toned as usual. (*Knight, &c.*)

cŏl-lō'-dĭ-ŏn, cŏl-lō'-dĭ-ŭm, *s.* [Gr. κολλώδης (*kollōdēs*) = like glue, viscous: κόλλα (*kolla*) = glue; εἶδος (*eidos*) = form, appearance.]

Pharm.: Collodion is prepared by dissolving one ounce of pyroxylin in a mixture of thirty-six fluid ounces of ether and twelve fluid ounces of rectified spirit. The pyroxylin or gun-cotton used for making collodion is prepared by immersing one ounce of cotton wool in a mixture of five fluid ounces of sulphuric acid, and five fluid ounces of nitric acid, for three minutes, then carefully washing it with water, and drying it in a water bath; it must be kept in a well-corked bottle. It is used in photography; also in surgery to form a protecting surface to the skin. Collodion is a colourless very inflammable liquid, which dries quickly when exposed to the air, leaving a thin transparent film insoluble in water or in rectified spirit.

collodion-process, *s.*

Phot.: A process in photography invented by Archer, who first published an account of it in the *Chemist* for March, 1851. An iodized collodion is made by impregnating a solution of gun-cotton in ether, with a small quantity of iodide of potassium or cadmium. A film of the iodized collodion is spread on the glass, which is then immersed in a solution of nitrate of silver. The image is taken in the camera, developed by a weak solution of pyrogallic acid and acetic acid, or a solution of protosulphate of iron. Excess of iodide of silver is removed by hyposulphite of soda or cyanide of potassium. This gives a negative. A positive is obtained by laying the negative on prepared paper and exposing them to light. (*Knight, &c.*)

cŏl-lō'-dĭ-ŏn-īze, *v.t.* [Eng. *collodion*; *-ize.*]

Phot.: To prepare, as a plate, with collodion; to treat with collodion.

cŏl-lō'-dĭ-ō-tўpe, *s.* [Eng. *collodio(n)*, and *type* (q.v.).]

Phot.: A name applied to those processes in which a film of sensitized collodion is used on a plate in obtaining an image. In the wet collodion process the plate is exposed while moist; in the dry collodion process the plate is first dried. The collodion positives are melanotypes and ambrotypes; the images are formed on the collodion, so as to be viewed by reflected or transmitted light. When viewed by reflected light they are termed ambrotypes. Collodion negatives are obtained on a film of sensitized collodion on glass. (*Knight.*)

1. *Chem.:* A term applied to non-crystalline bodies that are unable to pass through a wet membrane. [Dialysis.]

2. *Geol.:* A term applied to partly amorphous minerals. (*Ogilvie.*)

B. *As substantive:*

Chem. (*pl.*): The name given by Graham to jelly-like bodies which are characterised by a remarkable sluggishness and indisposition to diffusion, or to crystallization; when pure they are nearly tasteless. The chief organic colloids are cellulose, gum, starch, dextrin, tannin, gelatin, albumen, and caramel. The following inorganic colloids are important: hydrated silica, hydrated oxides of iron, alumina, chromium, &c. Some colloids are soluble in water, as gum; others, as hydrated silica and hydrated oxides of metals, can be obtained in solution by dialysis (q.v.). Some colloids combine with water, as gelatin and tragacanth, which may be called water of gelatinization. Colloids in solution easily pass from the liquid to the gelatinous state. Colloids readily permit the diffusion of crystalline salts through them, but are perfectly impervious to colloidal substances like themselves, hence such substances afford an easy method of separating crystalline substances from colloids, and by means of dialysis, crystalline poisons are readily separated from food, &c. (*Miller: Chemical Physics, &c.*)

colonial office. The office where business connected with the government of the Colonies is carried on. A Secretary of State for the Colonies was first appointed in 1768. In 1782 the title was abolished again and the Colonies placed under the Home Secretary, and in 1801 the Secretary for War. In 1854 the original arrangement was reverted to, and there have been Colonial Secretaries ever since.

B. *Technically:*

I. *History:*

1. *Phenician Colonies:* Ere yet the Latin word existed, or at least had acquired the meaning of colony, nations whose territory was too small for their population, sent forth some of their numbers to occupy other regions. The great maritime nation of antiquity, the Phenicians, were also early colonisers. Tyre was called by Isaiah "the daughter of Zidon," ch. xxiii. 12, by which is meant that Tyre was originally a Sidonian colony. Tyre in turn founded various settlements, such as Carthage, Gades (Cadiz), and others.

2. *Grecian Colonies:* Almost every Greek state and tribe sent forth colonies; the whole west of Asia Minor and the adjacent islands were studded with them, as was Southern Italy; besides these, the Corinthians founded Syracuse in Sicily, and the Phocæans Marseilles in Southern France. It is, however, worthy of remark that κολωνία (*kolōnia*), in Greek, primarily meant a grave, and not a colony, and when, in the Acts of the Apostles (xvi. 12), it is used in the latter sense, it is only as a Greek method of writing the Roman word.

3. *Roman Colonies:* The Phenician and Greek colonies were small states independent of the mother country; the Roman colonies, however, were subject to the parent government. They were of two kinds—citizen or civil colonies, with a plough upon their coins, and military colonies, with warlike ensigns on theirs.

4. *Modern European Colonies:* In founding colonies, as in so much more, Italy led the way, Pisa, Genoa, and Venice having done so in mediæval times. Spain and Portugal followed next, the former in America, the Philippine Islands, &c., the latter chiefly in the East Indies and in Brazil. Holland succeeded Portugal in the East Indies, and occupied the Cape of Good Hope, taken from it during the Napoleonic war. France has been unfortunate in its colonies, many of which are now under the sway of the English ruler. The British colonial empire is the most magnificent the world has ever seen or will see. New England settled by the Puritans, Pennsylvania by the Quakers, and Virginia by the Cavaliers, became the nucleus of the great colony which, becoming independent in 1776, has developed into the United States, now more populous by some 30 millions than the mother country, and occupying an area of about 3,556,650 square miles. The Dominion of Canada, aggregated around the territory surrendered by the French in 1763, has an area of about 3,620,510 square miles, while the whole British possessions in America have about 4,350,000. The area of Europe, on the other hand, is about 3,768,000 square miles. Australia, all of which is claimed by Great Britain, is believed to have about 2,967,500 square miles. Adding New Zealand and other settlements in the Pacific, this is brought up to about 3,181,344. The area of the Cape Colony and the adjacent more or less settled territories is at least 240,110 square miles; the English African possessions about 270,000. Guiana in South America has an area of about 100,000 square miles. The United States have no colonies, and have avoided a colonial policy.

II. *Law:* Colonies were obtained (1) by conquest, (2) by cession under treaty, (3) by occupancy, (4) or by hereditary descent. In the first two cases the colony retains its own laws till they are altered by the Sovereign or Council, subordinate however to Parliament. In the third case the colony, which is of the type called a plantation, is under such English laws as are applicable to a community of this type. In the fourth case, the laws previously existing are in force till modified by Parliament. The larger colonies are now very nearly independent. The Home authorities appoint their governors, but they have legislatures of their own, which sometimes exert their power in taxing manufactured goods imported from the mother country, and they are encouraged to raise troops and trust to them for defence in ordinary emergencies.

III. *Botany:* A group of fungi or algæ (generally unicellular), produced by division from a parent cell, and forming groups or chains.

IV. *Zool.:* An aggregate of individuals, such as a polypidom; used generally of the Actinozoa, Hydroida, and Polyzoa, but frequently employed of the social or compound Ascidians, of which Botryllus and Clavellina are examples. [TUNICATA.]

V. *Geol.:* A phenomenon to which attention was called by M. Barrande, the eminent Bohemian palæontologist, and which has been defined as the co-existence of two general faunas, which considered in their entirety are nevertheless distinct. The Lower and Upper Silurian rocks have different assemblages of fossils. In examining Lower Silurian strata Barrande found that certain Upper Silurian fossils made their appearance in particular beds, then vanished, then reappeared again some beds higher in the series, but which still were Lower Silurian. It is a canon of geology that no species which once becomes everywhere extinct is ever again reintroduced. Barrande is therefore of opinion that an Upper Silurian sea, with groups of characteristic fossils, existed in one part of Europe while a Lower Silurian one had not departed from Bohemia. The barrier between the two was occasionally broken down to a partial extent, allowing the escape of a few species from the one to the other. Further investigation has shown that Barrande's instances are fallacious, and due to inversions of strata.

Min.: A variety of coarse granular brownish yellow or reddish brown garnet, resinous in lustre, like colophony, and usually with iridescent hues. It is found at Arendal in Norway. (*Dana & Phillips.*)

cŏl-ŏ-phŏn′-ōne, *s.* [Eng. *colophon(y),* and suff. *-one.*]

Chem.: $C_{11}H_{18}O$. An oil obtained by the dry distillation of colophony. It is a colourless refractive liquid, boiling at 97°.

cŏl-ŏph′-ŏn-ȳ, *s.* [COLOPHONIA.]

Chem.: The resinous substance which remains when turpentine or pure resin is heated till the water and volatile oil is expelled. It is a mixture of several resinous isomeric acids, $C_{20}H_{30}O_2$. They are probably formed by the oxidation of turpentine oil, thus $2C_{10}H_{16} + O_2 = C_{20}H_{30}O_2 + H_2O$. Colophony varies in colour from light yellow to brown, according to the heat at which it has been prepared. It softens at 70° and melts at 135°; at higher temperatures it gives off volatile oils, and yields colopholic acid. When distilled in iron retorts it gives off gases, and a yellow strong smelling liquid distils over, called essence of rosin, which yields by fractional distillation colophonone, and then an optically indifferent camphene, boiling at 160°, and afterwards a viscid fluorescent oil, called rosin oil, which, when treated with quicklime, has the formula $C_{30}H_{40}O$. Colophony is used for making varnishes and cements, in preparing ointments, and as a reducing agent in the soldering of metals, for adulterating soap, and for rubbing the bows of violins. Colophony distilled with lime in retorts gives off gases of the paraffin series, also propylene, amylene, acetone, and a substance having the formula $C_5H_{10}O$. When colophony is distilled with superheated steam at a comparatively low temperature, benzene is produced in considerable quantity, and at a higher temperature, toluene. Colophony, oxidised in a retort by one part nitric acid and two parts water, yields isophthalic and tremellitic acids. The syrupy mother liquid, treated with fusing nitric acid, yields a crystalline mass of terebic acid. (*Watts: Dict. Chem.*)

cŏl-ō-quĭn'-tĭ-da, *cŏl'-ō-quĭnt, *s.* [Sp. & Ital. *coloquintida*; Fr. *coloquint*, from Gr. κολοκυνθις (*kolokunthis*), genit. κολοκυνθιδος (*kolokunthidos*).] The Colocynth (q.v.).

¶ The form *color* prevails in America, and the form *colour* is universally used in Great Britain. The same variation obtains in the spelling of words of like form, such as *vapor, honor, behavior*, &c.

(7) Applied euphemistically to members of those races of mankind whose skin is of a dark color; as people of *color* (negroes).

II. *Technically:*

1. *Optics:* Color in optics is viewed chiefly in connection with the solar spectrum. When the white line which reaches us from the sun passes from one medium into another, the phenomenon of dispersion takes place, that is, the light is decomposed into several colors. They are generally stated to be seven in number, viz., violet, indigo, blue, green, yellow, orange, and red. As these may be produced when light is transmitted through a prism, they are generally called prismatic colors. They are not all equally refrangible, the violet being the most so and the orange the least. On the theory of Sir Isaac Newton, who was the first to decompose white light by the prism and again recompose it, bodies decompose light also by reflection, and their color depends on their reflecting power for the different simple colors. Those which reflect all colors in the proportion in which they exist in the spectrum are white; those which reflect none are black. Between these two limits there are infinite numbers of tints, according to the greater or less extent to which bodies reflect some colors and absorb others. On this theory, or hypothesis, bodies have no color in themselves, but these are produced by the kind of light which they reflect. (*Ganot.*) Some colors are complementary to each other. [Complementary.] A simple color is one which cannot be decomposed.

2. *Bot.:* The tissue of plants is for the most part colorless, of a silvery white, or an exceedingly pale yellow. The cause of the subsequent color is the action of the solar light which produces chlorophyll (q.v.). When no abnormal causes are present to alter its action, this makes the epidermis of every part of the plant, except that of the flower, green. When plants naturally green become variegated it is generally a diseased state, though capable of being transmitted to the posterity of the plant.

The researches of De Candolle have shown that there are two series of colors in plants, a cyanic and a xanthic one. The former is called, by Schuübler and Frank, the oxidized series, and the latter the deoxidized one. Under the cyanic series of colors are to be ranked red, orange-red, orange-yellow, yellow, yellow-green, then green, occurring specially in the leaves of plants, stands as a connecting link between the two series, whilst under the xanthic series are to be placed blue-green, blue, blue-violet, violet-red, and red. [Coloring matter.] Prof. Dickie, of Aberdeen, has traced beautiful relations between form and color in the corollas of plants. [Corolla.]

Bischoff, Lindley, &c., considered that there are, in botanical terminology, eight principal colors, under which all others may be arranged —white, gray, black, brown, yellow, green, blue, and red. For subdivisions of these see the words themselves. Note, however, should be taken of the fact that the adjective *colored* has a special botanical signification inconsistent with this arrangement. [Colored, *Bot.*]

3. *Painting:* The coloring pigments used by painters.

4. *Dyeing:* Colors used in dyeing are of two kinds—*adjective colors*, those which require the use of a mordant, and *substantive colors*, in which no mordant is required.

5. *Phren.:* That faculty which is supposed to give the power of perceiving and appreciating colors and their various shades.

6. *Music:*

(1) A term variously employed in mediæval treatises on music to represent: a repetition of a sound in part music (repetitio ejusdem vocis); purity of tone (pulchritudo soni); a movement of the voice from the part (florificatio vocis); an alteration of rhythm by different voices (idem sonus repetitus in tempore diverso a diversis vocibus); a discord purposely introduced for the sake of variety (aliquando unus eorum ponitur in discordantiam propter *calorem* musicæ). Some have gathered from the definition—"Repetitio diversæ vocis est idem sonus repetitus in tempore diverso a diversis vocibus," that a musical *canon* is meant to be described.

(2) Now, the melodic, harmonic, and rhythmic effects giving specific character to a musical composition.

(3) The colored lines first used for the purpose of rendering *neumes* more intelligible. "Quamvis perfecta sit positura neumarum, cæca omnino est et nihil valet sine adjunctione literarum vel *colorum*" (*Guido*). [Clef, Notation.]

7. *Military:*

*(1) The cognizance or insignia of a knight.

(2) The flag, ensign, or standard of an army, fleet, or regiment (only in the plural).

¶ The plural form is occasionally (and very questionably) used with a singular article.

"An author compares a ragged coin to a tattered *colors*."—*Addison.*

¶ *To fear no colors:* Properly a military expression = to fear no enemy; hence, to have no fear.

"*Cl.* He that is well hanged in this world, needs *fear no colors*." *Shakesp.: Twelfth Night*, i. 5.

8. *Printing:* Ink of any shade.

9. *Law:*

(1) An appearance or *primâ facie* right, or appearance of title, furnishing a reasonable ground for action.

(2) A probable but really false plea, the design of which was to draw the decision of the case from the jury to the judge, by making the point so be decided to appear to be one of law and not of fact. (*Ogilvie.*)

¶ *Color of office:*

Law: An act unjustly done through the countenance of an office, which is given as a colorable pretext for it when its real origin is corruption.

¶ Crabb thus discriminates between *color, hue*, and *tint:* "*Color* is here the generic term; *hue* and *tint* are but modes of *color*; the former of which expresses a faint or blended *color*; the latter a shade of *color*. Betwixt the *colors* of black and brown, as of all other leading *colors*, there are various *hues* and *tints*, by the due intermixture of which natural objects are rendered beautiful." (*Crabb: Eng. Synon.*)

B. *As adj.:* (See the compounds).

color-bearer, *s.* One who carries the flag or colors (of a regiment, &c.).

color-blind, *a.* Affected with, or suffering from, color-blindness.

color-blindness, *s.* A peculiar defect of sight in which those who are affected are incapable of distinguishing different colors. Some see everything either to be light or dark, and have no conception of any other colors. This condition is, however, happily rare. Others, again, cannot distinguish either the primary colors from each other or from the secondary, confounding red with blue, blue with green, &c. It is calculated that about 4 per cent. of males and 5 per cent. of females of the people of the United States and Europe suffer from some form of this defect. An English chemist named Dalton, who suffered from color-blindness, was the first (1794) to draw attention to it, and hence the affection is frequently called Daltonism. [Daltonism.]

color-box, *s.* A box for holding artists' colors, brushes, &c.; also, a vessel holding the colors employed in printing calicoes; a device for combining designated spectral colors in specific proportion.

color-chest, *s.* On shipboard, a receptacle for the various signal flags.

color-de-roy, *s.* [Fr. *couleur de roy* = "in old time, purple; now the bright tawny" (*Cotgrave*).]

"Ane gown of *colour-de-roy* . . ."—*Aberd. Reg.*, A. 1543, v. 18.

color-doctor, *s.*

(1) A roller of gun-metal or steel pressed against the face of the engraved roll for calico-printing, and receiving a tremulous motion to slightly abrade the copper surface and enable it to hold the color more effectually.

(2) A sharp-edged ruler of gun-metal presented at a tangent upon the engraved cylinder of the calico-printing machine. The doctor acts as a wiper to hold back superfluous color, and has a slight reciprocating motion in contact with the surface of the cylinder. A lint-doctor on the other or delivery side of the roller removes fibres of cotton from the cylinder. [Ductor.]

color-guard, *s.*

Military: A detachment whose duty it is to guard the colors. In the U. S. Army the regimental color-guard consists of one sergeant, who is the color-bearer, and two experienced soldiers selected by the colonel.

color-line, *s.* A distinction more or less closely drawn between the white and black races as to social relations, &c. (*U. S.*)

color-man, *s.* One who prepares and deals in artists' colors, brushes, &c. (*English.*)

color-plate, *s.* An engraved plate from which is printed one of the colors making up a combination in imitation of lithography; generally produced by the half-tone process.

color-printing, *s.* Printing by a succession of colors, or by various colors occupying parts of the sheet. There are various modes. One of the latest is as follows: The reds, yellows, and blues are separately photographed by a secret process; from these negatives three plates are made by the half-tone method, and upon printing from them successively the subject is reproduced in all its original hues by the blending of these three primary colors. [Chromatic Printing.].

color-sergeant, *s.*

Milit.: The sergeant appointed to carry or guard the colors. [Color-guard.]

color-top, *s.* A top painted in various colors so as to show, in its rotation, the effect of their combination.

2. Specious, plausible; apparent and not real.

3. Appearing just and true, but not yet so proven.

¶ Crabb thus distinguishes between *colorable, specious, plausible, feasible,* and *ostensible:* "What is *colorable* has an aspect or face upon it that lulls suspicion and affords satisfaction; what is *specious* has a fair outside when contrasted with that which it may possibly conceal; what is *ostensible* is that which presents such an appearance as may serve for an indication of something real; what is *plausible* is that which meets the understanding merely through the ear; that which is *feasible* recommends itself from its intrinsic value rather than from any representation given of it. A pretence is *colorable* when it has the *color* of truth impressed upon it; it is *specious* when its fallacy is easily discernible through the thin guise it wears; a motive is *ostensible* which is the one soonest to be discovered; an excuse is *plausible* when the well-connected narrative of the maker impresses a belief of its justice; an account is *feasible* which contains nothing improbable or singular." (*Crabb: Eng. Synon.*)

Entom.: A beetle first described by Thomas Say, in 1824, from specimens found by him near the Upper Missouri. He called it *Doryphora decemlineata.* The genus Doryphora had been previously founded by Illiger. It comes from Gr. δορυφόρος (*doruphoros*) = spear-bearing, the reference being to the fact that in these insects the mesosternum is advanced to a point like a horn. The genus is American, and is placed under the Chrysomelidæ. The larva of the species distinguished as *decemlineata* feeds greedily on the potato, an having attracted notice in Colorado for its ravages among the crops of that esculent in the territory, it moved eastward year by year, till in 1874 it had reached the Atlantic sea-board. Between 1874 and 1876 Canada was ravaged. It is destroyed by dusting the plants with Paris green, which method has proved so effective that comparatively little damage is now done by this pest. ¶ *Epistle to the Colossians:*

Scripture Canon: An epistle addressed by St. Paul to the Church of Colosse. Its genuineness and authenticity are amply supported by quotations from it in the writings of Irenæus, Clement of Alexandria, and Tertullian, besides allusions to it by Justin Martyr and Theophilus of Antioch. Most modern critics are in its favour, the chief exceptions being Mayerhoff and Baur. The epistle was written probably at Rome, in or near the year A.D. 62, though some have thought it was penned earlier, and at Cæsarea. The Church at Colosse seems to have had as its founder Epaphras, a native of the place (Col. i. 7, iv. 12, 13), who is probably a different person from the Epaphroditus of Philip. ii. 25. Epaphras having carried Paul at Rome intelligence regarding the state of the Colossian Church (i. 8), Paul penned the present epistle, despatching it by the hands of Tychicus (iv. 7, 8), who carried also with him that to the Ephesians (Eph. vi. 21). Onesimus at the same time was returning with a message to his master, Philemon, who lived at Colosse (Philem. 10, Col. iv. 9). There is a striking resemblance between many passages in the epistle to the Colossians and that to the Ephesians, but there are differences too. The epistle to the Colossians appears to have been penned first, and that to the Ephesians a few days later.

The Colossian Church seems to have been mainly Gentile (i. 25—27, ii. 11—13, iii. 5—7), but at the time when the apostle wrote it was troubled by converts from Judaism, who sought to impose the yoke of ceremonial observance on their Gentile brethren (ii. 10—17), in addition to which doctrines were advocated by the same or by other individuals regarding angels and such supernatural beings, in which may be discerned the germ of gnosticism (ii 18—23). These opinions St. Paul earnestly combats, contending for Christian liberty and for the supreme dignity of Christ. According to Eusebius, Colosse was destroyed by an earthquake the year succeeding that in which this epistle was written.

II. *Technically:*

1. *Arch.:* A pillar, shaft, or solid body of considerably greater length than thickness, standing upright, and generally serving to support some superincumbent mass. It is the principal part in the ancient orders of architecture. There are five orders of architecture, each having its own proper style of column. [ARCHITECTURE.] The Grecian-Doric has no base, and in some other respects differs from the Roman-Doric, which is an imitation of it. It was short, powerful, and massive, and very simple in character. Its height was between seven and eight diameters. The Ionic column was distinguished by its volutes, and was nine diameters in height. The Corinthian, which was ten diameters high, was adorned with leaves, &c., and was noted for its lightness and richness of decoration. Of these the Doric and Ionic were the earliest and oftenest employed in Greek architecture. The Corinthian was preferred by the Romans. The parts of a column are: (1) the plinth, (2) the torus, (3) the shaft, (4) the astragal, (5) the neck, (6) the ovato, (7) the abacus (see these words). Above these rose the entablature.

Med.: A morbid state which, if considered a distinct disease, is a milder form of apoplexy but which may be properly regarded as a symptom rather than an idiopathic affection. It is characterised by a morbid condition of the brain, producing loss of sensation and voluntary motion, so that the patient seems as if in a deep sleep. It constitutes the most pronounced state of torpor which can occur, the succession being as follows: When a patient is so overcome by lassitude that he tends perpetually to sleep, is incapable of muscular exertion, and cannot, except when excited, give attention to what is passing around, his state is called *lethargy;* when a mechanical stimulus, such as that of pricking or pinching him, will restore him to partial consciousness, it is *carus;* when not even this will rouse him, it is *coma.* The cerebral functions are suspended in coma, and the nervous and sanguiferous systems deranged. There are two well-marked types of it, one in which the pulse is oppressed, irregular, and slow; and the other in which it is strong, with a hot skin and other marks of febrile inflammation. When coma is intense it passes into apoplexy (q.v.).

"The condensation of the substance of the hemispheres, which is produced by an apoplectic clot or by the effusion of some other foreign matter, prevents a similar consent of action, and thus gives rise to the phenomena of *coma,* in which all mental nervous actions are destroyed or suspended."—*Todd & Bowman: Physiol. Zool.: A genus of Echinoderms, the typical one of the family Comatulidæ. One species, *Comatula* (or *Antedon*) *rosea*, is found in the British seas. Its young are so unlike the mature animal that they were placed in a distinct family and called *Pentacrinus europæus*.

They have both the mouth and anus on the lower or ventral surface, possess ten slender arms and slender-jointed cirri, enabling them to creep about at the bottom of the sea. Species have been found in most parts of the world. [Comatula.]

"A *coomb* of hony."—*Wycliffe: Luke* xxiv. 22.

". . . when the bee doth leave her *comb*."
Shakesp.: 2 Hen. IV., iv. 4.

¶ The comb of a bee is composed, as stated above, of hexagonal cells, of which there are two tiers, the cells in which are placed end to end, so that the three plates of wax, which serve as the bottom of the cell in the one tier, constitute also the top of the corresponding one in the other. The mathematical problem in "maxima and minima," how to construct the greatest number of cells within the smallest possible room, and with the least expenditure of material, is solved. This the natural theologians and the older naturalists were accustomed to adduce, as one of an infinite number of proofs, that design and a Designer were displayed in nature. [Design.]

The *combatants* in the Olympic games used to contend for a prize; the Roman gladiators were *combatants*

who fought for their lives: when knight errantry was in fashion, there were *champions* of all descriptions . . . The mere act of fighting constitutes the *combatant:* the act of standing up in another's defence at a personal risk constitutes the *champion* . . ." (*Crabb: Eng. Synon.*)

B. *Technically:*

1. *Arith., Algebra, &c.:* The different collections which may be made of certain given quantities without regard to the order in which they are arranged in each collection. The term is almost always mentioned in conjunction with permutations in which there is regard to the order of the quantities, and a department of arithmetic is technically called Permutations and Combinations. If *a, b,* and *c* be three quantities to be taken two together, there will be three possible combinations, that is, ways of arranging them in pairs, without allowing *b* to stand before *a,* or *c* before the two letters which precede it in the alphabet. These combinations will be *ab, ac,* and *bc.* But there can be six permutations of the same three letters; *i.e.,* six distinct pairs of them if permission be granted to put them in any order one pleases, viz., *ab, ba, ac, ca, bc, cb.* [PERMUTATION.]

2. *Chem.:* The act of uniting by means of chemical affinity; the state of being so united. There are two kinds of chemical combination, that by weight and that by volume. In a large number of instances the law relating to combination by weight is as follows:—When two bodies, A and B, are capable of uniting, the several quantities of B, which combine with a given or constant quantity of A, stand to one another in very simple ratios. [MULTIPLE (*Chem.*), EQUIVALENT, ATOMIC.] With regard to gases combining by volume, the law is that the combining volumes of all elementary gases are equal, excepting those of phosphorus and arsenic, which are only half those of the other elements in the gaseous state, and those of mercury and cadmium, which are double those of the other elements. (*Fownes.*)

". . . we have theu what is called a chemical *combination*."—*Tyndall: Frag. of Science* (3rd ed.), i. 10.

3. *Law:* A term defined as an "assembly of workmen met to perpetrate unlawful acts." From the time of Edward I., the law attempted to regulate the price of labour, and prohibit the workmen from combining. By 2 & 3 Edw. VI. c. 15, combinations to raise wages became severely punishable. These laws were repealed in 1825. Still, most of the objects aimed at by workmen's combinations were held to be in "restraint of trade," and therefore illegal, but at present trade unions are considered legitimate combinations, even if their action should in any case be deemed in restraint of trade. Interference with the freedom of action of those workmen who do not join them is not permitted; in all other respects they are free. Similar restraining laws were early passed in the United States; but they have been repealed, and workmen are quite free to combine. The only restriction is against violence.

¶ Crabb thus discriminates between *combination, conspiracy, cabal,* and *plot:* "An association for a bad purpose is the idea common to all these terms, and peculiar to *combination.* A *combination* may be either secret or open, but secrecy forms a necessary part in the signification of the other terms; a *cabal* is secret as to its end; a *plot* and *conspiracy* are secret, both as to the means and the end. *Combination* is the close adherence of many for their mutual defence in obtaining of demands, or resisting of claims. A *cabal* is the intrigue of a party or faction, formed by cunning practices in order to give a turn to the course of things to its own advantage: the natural and ruling idea in *cabal* is that of assembling a number, and manœuvring secretly with address. A *plot* is a clandestine union of some persons for the purpose of mischief: the ruling idea in a *plot* is that of a complicated enterprise formed in secret, by two or more persons. A *conspiracy* is a general intelligence among persons united in sentiment to effect some serious change: the ruling and natural idea in this word is that of unanimity and concert in the prosecution of a plan. A *combination* is seldom of so serious a nature as a *cabal,* or a *plot,* though always objectionable; a *combination* may have many or few." (*Crabb: Eng. Synon.*)

The alcohol with which it is assumed that their organs were saturated, electricity, phosphoretted hydrogen, or other inflammable gas set free by the decomposition of the structures have been assigned as possible causes, but the subject requires well-ascertained modern facts and fresh scientific elucidation. "I have not attempted anything of a pastoral *comedy*, because, I think, the taste of our age will not relish a poem of that sort."—*Pope: Letter to H. Cromwell*, July 2, 1706.

¶ Comedy took its origin in the Dionysian festivals, with those who led the phallic songs of the band of revellers (κώμος) who, at the vintage festivals, gave expression to the exuberant joy and merriment by parading about, dressed up, and singing jovial songs in honour of Dionysus. These songs were frequently interspersed with extemporised jokes at the expense of the bystanders. Comedy first assumed a regular shape amongst the Dorians. The first attempts at it amongst the Athenians were made by Susarion, a native of Megara, about B.C. 578. Epicharmus first gave comedy a new form and introduced a regular plot. That branch of the Attic drama known as the *Old Comedy* begins properly with Cratinus. It lasted from B.C. 458 to B.C. 404. The later pieces of Aristophanes belong to *Middle Comedy*. The chorus in a comedy consisted of twenty-four. [Chorus.] *Middle Comedy* lasted from B.C. 404 to B.C. 340, and the *New Comedy* till B.C. 260. *Middle Comedy* found its materials in satirising classes of people instead of individuals. *New Comedy* answers to the comedy

of the present day. The most distinguished of Roman comic writers were Plautus and Terence, whose plots were mainly derived from their Greek predecessors.

1. *Astronomy:*

(1) *Definition:* A luminous heavenly body which, in general, consists of a nucleus or "head" with, or less frequently without, a tail, the whole moving in the heavens, first towards, then around, and finally away again from the sun, like a planet at one part of its elliptic orbit.

(2) *Hist.:* Comets have in every age excited attention, and, till recently, have inspired terror, at least in ignorant minds. Milton expressed the general belief in the lines:—

"Satan stood . . . and like a *comet* burned,
That fires the length of Ophiuchus huge
In th' artick sky, and from his horrid hair
Shakes pestilence and war."
Milton: P. L., ii. 708.

Josephus enumerates as one of the omens foreboding the destruction of Jerusalem, "a star resembling a sword which stood over the city, and a comet that continued a whole year." (*Wars of the Jews,* bk. vi., ch. v., § 3.)

From these notions science had to grope its way forward. Aristotle thought comets igneous vapours not higher than our own atmosphere. Seneca gave forth the happy hypothesis that they were a kind of planets. Tycho Brahe, about 1577, showed that a certain comet was at a greater distance from the earth than the moon. Hevelius, in 1668, ascertained that the orbit of a comet was concave and not a straight line, the latter erroneous view having been held by Tycho Brahe, already mentioned, and Kepler. Doerfel (1681) believed comets to move in parabolas. In 1682, Halley proved the comet, subsequently called after him, to be periodic in its returns. In 1704, Sir Isaac Newton proved comets to obey the law of gravitation, and held that in all probability they moved in elliptic orbits. For more modern discoveries, see 3.

(3) *Present state of knowledge and opinion:* More than 600 comets, according to Mr. Hind, have been taken note of, but about 17,500,000 are believed to exist in connexion with the solar system. The head or nucleus is much less solid than it seems. Thus, in 1832, Sir John Herschel saw a group of stars only of the 16th magnitude, almost through the centre of Biela's comet. When such a body might be expected to exercise gravitation its influence is too small to be perceptible. Regarding orbit, the comets may be divided into two very distinct classes: First, those whose orbits are so long that they are usually regarded as parabolas, and second, those whose orbit and period are both short. Of the latter class, about twelve or fifteen are known. The first seem to have come to us from outside space; the second set, originally belonging to the former, to have had their direction changed so as to produce their present short elliptic orbits by the action on them of some planet. (*Brit. Assoc. Rep.* (1879), p. 272.) For the chief comets of the latter type, see ¶ at the end of this article. In 1866, Professor Schiaparelli, of Milan, discovered that the orbit of Tuttle's comet, the third which had appeared in 1862, was nearly identical with that of the August meteors, and Tempel's comet, the first of 1866, with that of the November meteor stream. In consequence of this discovery, Prof. P. G. Tait, F.R.S.E., published the view that the sudden development of tails many millions of miles in length, the occurrence of comets with many tails, and the observed fact that there is no definite relation of direction between a comet's tail and its solar radius vector, may be accounted for on the supposition that a comet is a cloud of small masses, such as stones and fragments of meteoric iron, shining by reflected light alone, except where these masses impinge on each other, or on other matter circulating around the sun, and thus produce luminous gases along with considerable modifications of their relative motion. The differences of motion of the meteoric fragments relatively to the earth, present appearances analogous to those of a flock of sea-birds flying in one plane, and only becoming as a long streak when the plane of the flock passes approximately through the spectator's eye. The so called envelopes surrounding them are compared with the curling wreaths of tobacco smoke emitted from a pipe. On the 24th June, 1881, Wm. Huggins, Esq., D.C.L., LL.D., F.R.S., examined the bright comet then in the sky with the spectroscope. Assuming this to be similarly composed to other comets, he came to the conclusion that part of their light is reflected sunlight and part original light, and further that carbon is present in the cometary matter. The comet of 1882 was shown to contain sodium and iron, in addition to carbon.

¶ Among the best known periodic comets are—

(1) *Biela's Comet:* [Named after M. Biela, an

Austrian officer, who discovered it at Prague on the 27th or 28th February, 1826.] A comet which has a periodic time of about 6½ years or 138 weeks. It returned in September, 1832, again in 1839, then in 1845; when, between December 19, 1845, and January 13, 1846, it separated into two comets, which went off in company, coming back together in 1852, since which time they have returned no more. But it has been discovered that when, towards the end of November, the earth intersects the lost double comet's path, there is a display of meteors. This was notably seen on Nov. 30, 1867, and on Nov. 27, 1872. Biela's is called also Gambart's Comet.

(2) *Donati's Comet:* [Named after Dr Donati of Florence.] A comet discovered by Donati on 2nd June, 1858. Periodic time about 2,000 years.

(3) *Encke's Comet:* [Named after Johann Franz Encke, Director of the Observatory at Berlin.] A comet, the periodicity of which was detected by Encke in 1819. He proved it identical with Mechain and Messier's comet of 1786, with Herschel's of 1795, and Pons's of 1805. It appeared again in 1822, 1828, and at such intervals as to show that its periodic time is 3·29 years, or 1,210 days. A recent appearance was on August 20, 1881. Its orbit is everywhere nearer the sun than that of Jupiter.

(4) *Halley's Comet:* [Named after the celebrated Edmund Halley, the friend of Newton, and, from 1720 to 1741–2, Astronomer-royal.] A comet, the first whose periodic time was ascertained. It is about 75 years. It was identical with the comets of 1456, 1531, and 1607, and appeared again in 1759 and 1835. It is next due in 1910. It is sometimes called Apian's Comet.

The three former of these are personal in their application; the latter is general: a *command,* an *order,* and an *injunction,* must be addressed to some particular individual: a *precept* is addressed to all. *Command* and *order* exclusively flow from the will of the speaker in the ordinary concerns of life; *injunction* has more regard to the conduct of the person addressed; *precept* is altogether founded on the moral obligations of men to each other. A *command* is just or unjust; an *order* is prudent or imprudent; an *injunction* is mild or severe; a *precept* is general or particular. *Command* and *order* are affirmative; *injunction* or *precept* are either affirmative or negative: the *command* and the *order* oblige us to do a thing; the *injunction* and *precept* oblige us to do it, or leave it undone." "These establishments formed at the same time branches, . . . On the first creation of these [branch] establishments, they were denominated Preceptories; the superior being called the preceptor; but eventually the name became changed to that of *commandery*, by which they were always afterwards known. The council reserved to themselves the power of at any time recalling a commander from his post, and substituting another in his place, at their pleasure; he being merely considered as the steward of their property. Time, however, gradually wrought a great change in the relative position which the commanders held to the council; and, eventually, a nomination to a *commandery* came to be considered in the light of a legal acquisition, subject only to the payment of a certain amount of annual tribute to the public treasury, which tribute received the name of Responsions."—*Major Porter: Hist. ¶ Crabb thus discriminates between *commanding, imperative, imperious,* and *authoritative:* "*Commanding* is either good or bad according to circumstances; a *commanding* voice is necessary for one who has to command; but a *commanding* air is offensive when it is affected: *imperative* is applied to things, and used in an indifferent sense: *imperious* is used for persons or things in the bad sense: any direction is *imperative* which comes in the shape of a command, and circumstances are likewise *imperative*, which act with the force of a *command*; persons are *imperious* who exercise their power oppressively; in this manner underlings in office are *imperious*; necessity is *imperious* when it leaves us no choice in our conduct. *Authoritative* is mostly applied to persons or things, personal in the good sense only; magistrates are called upon to assume an *authoritative* air when they meet with any resistance." ¶ Every preacher is to a certain extent a commentator ; thus, St. Peter, in his address on the day of Pentecost, commented on Psalm xvi. 10 (see Acts ii. 27, &c.), and St. Paul, in the synagogue at Antioch, in Pisidia, did so on Psalms ii. 7., xvi. 10, and Hab. i. 5 (see Acts xiii. 33—41). But the first commentator, more specifically so called, seems to have been Pantænus, the master of the Alexandrian School in the second century. Others who attempted to explain either the whole or part of the Scripture were Clemens Alexandrinus, Justin Martyr, Theophilus of Antioch, in the second century ; Origen, Hippolytus, Victorinus, Methodius, in the third ; Jerome, Hilary, Eusebius, Diodorus of Tarsus, Rufinus, Ephrem Syrus, Theodore of Heraclea, Chrysostom, Athanasius, and Didymus, in the fourth. Every subsequent century had its commentators ; it would be difficult, and require too much space to attempt to enumerate those of the present one. Matthew Henry's "Exposition of the Old and New Testaments," of which the portion from Genesis to the end of Acts had been completed when the author died, on June 22nd, 1714, the rest having been added by other writers, is practical rather than critical ; from its high spiritual tone it has gained a place, which no other commentary has, in the affections of pious people throughout the land. Since that time the critical study of the Scriptures has greatly advanced, and numerous distinguished commentators have arisen, both in this and in other countries.

A. *Ordinary Language:*

I. *Lit.:* Trade, traffic; the exchange of articles for each other or for money. [B. 1.]

"Where has *commerce* such a mart,
So rich, so thronged, so drained, and so supplied,
As London?"
Cowper: Task, i. 719.

II. *Figuratively:*

1. Social intercourse or dealings.

". . . his *commerce* with the world had been small."—*Macaulay: Hist. Eng.*, ch. i.

2. Sexual or carnal intercourse.

B. *Technically:*

1. *Commerce:*

(1) *Definition:* When the word is used with an extended meaning, it signifies mutual exchange, buying and selling whether abroad or at home; but in a more specific or limited sense it denotes intercourse or transactions of the character now described with foreign nations or with the colonies; mutual exchange or buying and selling at home being designated not commerce but trade.

(2) *Hist.:* The Phenicians, whose primitive seat was at Sidon and their next at Tyre, were the great commercial nation of the old world. Tyre was called "the crowning city whose merchants are princes, whose traffickers are the honourable of the earth." (Isa. xxiii. 8.) How varied were the articles in which they traded, a chapter of Ezekiel, of peculiar historic value, tells (Ezek. xxvii). It was written about 588 B.C. The Greeks with all their intellect, and the Romans with their unparalleled opportunities, did not show remarkable aptitude for commerce, nor was their success high.

In the middle ages, the Venetians, the Pisans, the Genoese, the Hanse or Hanseatic towns and Flanders, either successively or in some cases two or more together, took the lead in commerce. The great impulse communicated by the discovery of America brought first the Spaniards and Portuguese, then the Dutch, and finally the British upon the scene. Even before this time London had become a large emporium of trade. William Fitz Stephens, speaking of the traffic in the reign of Henry II., says:—

"Arabia's gold, Saba's spice and incense;
Scythia's keen weapons, and the oil of palm
From Babylon's deep soil; Nile's precious gems,
China's bright shining silks, and Gallic wines,
Norway's warm peltry, and the Russian sables,
All here abound . . ."

The tranquil and economic reign of Queen Elizabeth gave an impulse to commerce, and before the 16th century had closed, the English engrossed, by an exclusive privilege, the commerce of Russia; they explored the sea of Spitzbergen for a passage to the markets of the East; they took an active part in the trade of the Mediterranean, and they excited the jealousy of the Hanse Towns by their operations in Germany and the continent of Europe. Other cities than London were now engaging in foreign trade, the merchants of Bristol doing so with the Canary Islands, and those of Plymouth with the coasts of Guinea and Brazil. Our traffic with India created the Anglo-Indian empire, and it again favourably reacted on the commerce which had given it birth.

(3) *Modern Commerce:* In the United States an enormous commerce has developed, conducted largely through the port of New York, and to a considerable extent through those of Boston, Philadelphia, Baltimore, and others. It is made up in somewhat similar proportions of articles exported and imported. Prof. Leone Levi, in his "History of British Commerce," expresses the view that the foundations of modern British Commerce were laid deeply and successfully between the end of the seven years' war (1763) and the depth of the French Revolution (1792). The mechanical skill of Lewis Paul, Lawrence Earnshaw, Hargreaves, Arkwright, and Crompton, improved the cotton machinery and gave the manufacturing supremacy to Britain. This giving an article to sell abroad, enabled much that was useful to be imported. A similar development took place with the woollen industry [WOOLLEN], and the iron manufacture [IRON MANUFACTURE.]

(4) *Law:* Anciently in a stricter and even yet in a looser sense, the King is arbiter of commerce. Theoretically he has the power to establish public markets and fares, with the tolls thereunto belonging, to regulate weights and measures, and to give currency to particular designations of coins. (*Blackstone: Comment.*, bk. i., ch. 7.)

¶ *Chamber of Commerce:* A society of merchants and others meeting at intervals to discuss matters connected with commerce. The first is said to have arisen at Marseilles in the 14th century. One was established in Glasgow in 1783, one in Edinburgh in 1785, and one in Manchester in 1820.

commercial law.

Law: Lex Mercatoria: The law regulating commercial transactions between the merchants belonging to different countries or merchants generally. It is derived from the custom of merchants, from international law, from the different maritime codes of ancient Europe, and from the imperial code of Rome. commercial treaties. Treaties made between two nations for the promotion of commerce between them. The first treaty of commerce into which England is known to have entered was one with the Flemings in 1272; another followed with Portugal and Spain in 1308. The celebrated commercial treaty with France, which was negotiated between Mr. Richard Cobden, the great Free-trader, representing England, and Napoleon III., as autocrat of France, was signed on January 23rd, 1860; it produced great advantages to both countries. Numerous commercial treaties have been made between the United States and countries having commercial relations with this land. Of these the most interesting are the treaties made under the Reciprocity clause of the McKinley Act, with the republics of Central and South America, some of the West India Islands, and some countries of Europe. Under these treaties free trade in certain articles was established between the countries concerned, the free imports to the United States being confined to coffee, sugar, and hides.

CORPUS CALLOSUM, OR GREAT COMMISSURE OF BRAIN.

there are commissures at each end of the eyelids uniting them, and one at each side of the mouth connecting the lips. The commissures of the body, which are most frequently mentioned by distinctive appellations, may be arranged in three categories:—

(1) *Commissures of the brain:*

"Certain systems of fibres exist in the cerebrum, which seem very evidently to unite portions of the same, or of opposite hemispheres. The most obvious of these *commissures* are the *corpus callosum*, the *anterior commissure*, the *posterior commissure*, the *soft commissure*, the *superior longitudinal commissure*, and the *fornix*. All, except the two last, are transverse, and unite parts of the hemispheres of opposite sides."—*Todd & Bowman: Physiol. Anat.*, vol. i., ch. x., p. 284.

(*a*) *Anterior commissure, anterior cerebral commissure,* or *white commissure:*

Anat.: A round bundle of white fibres placed immediately in front of the anterior pillars of the fornix, and crossing between the corpora striata of the cerebrum. It marks the anterior boundary of the ventricle.

Anat.: A large commissure connecting the centres of the two hemispheres of the cerebrum. It is called also the *corpus callosum.* (*Quain.*)

(*c*) *Great transverse commissure of the cerebellum:* For def. see extract.

"The fibres of the pons are always developed in the direct ratio of the hemispheres of the cerebellum . . . Hence these fibres must be regarded as especially belonging to the cerebellum, and as serving, whatever other office they may perform, to connect the hemispheres of opposite sides. They constitute, therefore, the *great transverse commissure of the cerebellum*, and are to the hemispheres of that organ what the corpus callosum is to those of the brain."—*Todd & Bowman: Physiol. Anat.*, vol. i., ch. x., p. 274.

(*d*) *Grey* or *Gray Commissure:* The same as *Middle commissure* (q.v.).

"The *gray commissure*."—*Todd & Bowman: Physiol. Anat.*, vol. i., ch. x., p. 256.

(*e*) *Middle or soft commissure:* A soft pale-grey layer or bridge, consisting of vesicular matter with nerve tubes which stretch from one optic thalamus to the other, dividing the third ventricle into a superior and an inferior portion. As it comprises vesicular matter, it is not a commissure in the same sense as the others which contain none. (*Todd & Bowman: Physiol. Anat.*, vol. i., pp. 278, 285, 286.)

(*f*) *Posterior commissure:* A cord of transverse fibres situated beneath the base of the pineal body, and mostly connected with the posterior extremity of each thalamus. (*Ibid.*, p. 278.)

"The *posterior commissure* crosses the posterior extremity of the third ventricle, and passes transversely between the optic thalami."—*Todd and Bowman: Physiol. Anat.*, vol. i., p. 285.

(*g*) *Soft commissure:* The same as *Middle commissure* (q.v.).

Anat.: A commissure enclosed in the internal convolution overhanging the corpus callosum. (*Ibid.*, p. 286.)

Anat.: A transverse portion of white substance connecting the opposite sides of the anterior median fissure of the spinal cord.

(*b*) *Posterior grey commissure of the spinal cord:*

Anat.: A transverse portion of grey matter connecting the opposite sides of the posterior median fissure in the spinal cord.

(3) *Optic commissure:*

Hist.: The name given to a committee of members of the French National Convention during the first revolution. When the National Convention, about the end of 1792, abolished monarchy and proclaimed a republic, it divided the executive government among several committees, paramount over which was the Committee of Public Safety, appointed on 6th April, 1793. When the Girondists were overthrown by the Revolution of 31st May, 1793, and the Jacobins, or the party of the Mountain, gained supreme power, the powers of the Committee of Public Safety were enlarged. It was the rule of this tyrannical and sanguinary committee which is known as the Reign of Terror. Robespierre was its animating spirit, next to whom stood Couthon and St. Just. The execution of these three men on the 10th Thermidor (July 28th, 1794) was a lesson to the more extreme party in the committee, which did not again perpetrate the same excesses as before, and it is considered as having terminated the Reign of Terror. In March, 1871, the Communists established a similar committee in Paris, which fell in May of the same year. [COMMUNE.]

3. An open and (generally) unenclosed space, the use of which is not restricted to any individual, but is free to the public, or to a certain number, as, "The Commons," in Boston. Park is a similar public space.

¶ Commons, where not necessary for the health and recreation of the people, are a wasteful method of using land; it produces less than if it were divided among different individuals. As population, therefore, increased, inclosures became necessary if the people were to be properly fed. Laws made for its purpose were favourable to the lord of the manor. By the statute of Merton and other subsequent enactments (20 Hen. III. c. 4, 29 Geo. II. c. 36, and 31 Geo. II. c. 41) he might inclose as much of the waste as he pleased for tillage or for wood ground provided he left common sufficient for such as were entitled thereto. A multitude of other Inclosure Acts followed, commencing with 41 Geo. III. c. 109, and running down to 31 and 32 Vict. c. 89. Under these, in 1845, Commissioners, called Inclosure Commissioners, were appointed. [INCLOSURES.] It was calculated in 1685 that of 37,000,000 acres of land existing in England, about 18,000,000, or nearly the half, were moorland, forest, and fen. Up till 1845 about 10,000,000 more acres were inclosed, bringing the total aggregate to 28,000,000; more than 1,000,000 have since been dealt with in a similar way.

But within recent years a reaction against inclosure has set in among the inhabitants of the great cities and towns, to whom open spaces within accessible distance are essential for health and recreation. Nowhere has this necessity been more felt than in London, and in 1866 an Act was passed for the improvement, protection, and management of the commons near the metropolis, while in 1878, the Metropolitan Board of Works were authorised to secure commons where opportunity offered near the metropolis. The great wooded common, known as Epping Forest, gained from the lords of the manors and others by a decision of the Master of the Rolls on 10th Nov., 1874, was transferred to the Corporation of the City of London, who had been the successful litigants, and after an arbitrator had settled all claims, Queen Victoria dedicated it on the 6th May, 1882, to the use of the people for ever.

"Hounslow Heath, on the great Western Road, and Finchley *Common*, on the great Northern Road, were perhaps the most celebrated of these spots."—*Macaulay: Hist. Eng.*, ch. iii.

II. *Law:* The right of enjoying any privilege in common with others; a community of interest or right. This may be of many kinds, as, *common of custom* = the right to take wood for fuel or repairs; *common of estovers* = the right of taking wood for fuel or for domestic purposes; *common of pasture* = the right of turning out a certain number of cattle to pasture on certain common lands: it is usually of three kinds—*appendant* (when the right is supposed to have belonged to the house from time immemorial, because the house was within the manor), *appurtenant* (when the right has become annexed to the house either by gift or purchase, or in some other way), and *in gross* (when the right belongs to a person to turn out on the common, and does not belong to any house or land); *common of piscary* = a right of fishing in waters belonging to another; and *common of turbary* = the right of digging turf on the lands of another.

¶ Crabb thus discriminates between *common, ordinary, mean,* and *vulgar:* "Familiar use renders things *common, vulgar,* and *ordinary;* but what is *mean* is so of itself: the *common, vulgar,* and *ordinary,* are therefore frequently, though not always, *mean;* and on the contrary what is *mean* is not always *common, vulgar,* or *ordinary;* consequently, in the primitive sense of these words, the first three are not strictly synonymous with the last: monsters are *common* in Africa; *vulgar* reports are little to be relied on. . . . *Common* is opposed to rare and refined: *vulgar* to polite and cultivated: *ordinary* to the distinguished: *mean* to the noble; a *common* mind busies itself with *common* objects; *vulgar* habits are easily contracted from a slight intercourse with *vulgar* people; an *ordinary* person is seldom associated with elevation of character; and a *mean* appearance is a certain mark of a degraded condition, if not of a degraded mind." Thus 4 is the greatest common measure of 12 and 16, for $\frac{12}{4} = 3$, $\frac{16}{4} = 4$. All civil causes, both real and personal, were formerly tried in this court, according to the strict laws of the realm; and Fortescue represents it as the only court for real causes. common-sense, *s.* & *a.*

A. *As substantive:*

I. *Ordinary Language:*

1. Originally signified a common internal sense, and what may be perhaps termed a collective sense, formed by the union of the five special ones, which were supposed to meet at some point in the body, as the radii of a circle converge to and unite in its centre.

"That there is some particular or restrained seat of the *common sense* is an opinion that even old philosophers and physicians are agreed upon. And it is an ordinary comparison amongst them that the external senses and the *common sense,* considered together, are like a circle with five lines drawn from the circumference to the centre. Wherefore, as it has been obvious for them to find out particular organs for the external senses, so they have also attempted to assign some distinct part of the body to be an organ of the *common sense;* that is to say, as they discovered sight to be seated in the eye, hearing in the ear, smelling in the nose, &c., so they conceived that there is some part of the body wherein seeing, hearing and all other perceptions meet together, as the lines of a circle in the centre; and that there the soul does also judge and discern of the difference of the objects of the outward senses."—*Henry More: Immortality of the Soul,* vol. iii., ch. 13. (*Trench.*)

2. The modicum of sense or understanding possessed by people in general; the power supposed to be possessed by people in general of deciding simple questions accurately; the common judgment of mankind.

His speech rebellion against *common sense*."

II. *Mental phil.:* When Berkeley, carrying out the system of idealism, had shown that on the principle which is laid down, the existence of the material world could not be proved, and Hume carried Berkeley's scepticism to a yet greater length, the Rev. Dr. Reid, Prof. of Mental Philosophy in King's College, Aberdeen, built up a system designed to be antagonistic to this sceptical one, in what he called common-sense. The first principles of belief which all ordinary men, not idiots or lunatics, accept undoubtingly, were assumed to be axiomatic, and became the foundation of a system of mental philosophy. Dugald Stewart, holding essentially the same views as Reid, thought the term common-sense an unhappy one, and substituted for it "the fundamental laws of human belief."

Of a view, &c.: Such a one as an ordinary person of sound judgment would take.

Common time is of two kinds, simple and compound. Simple common time is that which includes four beats in a bar, or any division of that number, or square of the number or its divisions. The signs used to express simple common time are the following: $\frac{2}{1}$, $\frac{2}{2}$, $\frac{2}{4}$, $\frac{4}{4}$, $\frac{4}{8}$, and the characters C and C. In these signs the upper figure denotes the quantity of notes required in the bar, and the lower figure the quality of the notes. Compound common-time is expressed by the signs $\frac{3}{4}$, $\frac{6}{8}$, $\frac{9}{8}$, such signs meaning two or four beats of three crotchets or quavers to each beat. 3. The House of Commons.

4. A ration or allowance of food.

¶ *To be on "short commons"*: To be scantily provided.

¶ (1) *Doctors' Commons:* [DOCTORS' COMMONS.]

(2) *House of Commons:*

(*a*) *Definition:* That one of the two Houses of Parliament which consists of representatives duly elected according to law in prescribed numbers by the burgh, county, and university constituencies of the United Kingdom. The name Commons is given to its members to distinguish them from the peers of the United Kingdom who sit in the House of Lords.

(*b*) *History:* The earliest traces of the House of Commons are in A.D. 1265. The year previously (on May 12, 1264), Simon de Montfort, Earl of Leicester, who was of French origin but brother-in-law to King Henry III., defeated his sovereign at the Battle of Lewes, and made him prisoner. In 1265 the victor issued writs in the King's name requiring each sheriff of a county to return to a parliament which he proposed to hold, two knights for the shire under his jurisdiction, two citizens for each city within its limits, and two burgesses for each borough. A parliament of lords and other dignitaries had existed previously; county representatives may occasionally have sat almost from the commencement of the 13th century, and an assembly of knights and burgesses, nicknamed the Mad Parliament, had met in A.D. 1258, but no writs are extant before De Montfort's, summoning the representatives of cities and boroughs to attend. The Parliament thus called together met in London on the 22nd January, 1265, but on the 4th August De Montfort was slain at the battle of Evesham, and the royal government restored. The victory was obtained for the king mainly through the military ability of Prince Edward, afterwards King Edward I., who, at least as early as 1294, *i.e.*, the 22nd year of his reign, himself called together a parliament of the De Montfort type. The borough representatives were 246, those from the counties or shires 74. Under Edward III. these numbers had altered to 282 and 74. Each place represented sent two members, without reference to its population. There was universal suffrage; members required no property qualification, and were paid. In the eighth year of Henry VI. the county franchise was narrowed in its operation, no one now being allowed to vote unless he possessed freehold worth 40 shillings, a sum the purchasing power of which would have been about the equivalent of £12 at the beginning of the 18th century, and £20 at the commencement of the 19th. The Act 23 Hen. VI. c. 14, made it an indispensable qualification for election as a member of Parliament that the person should be a knight, or eligible to be one, by which was meant that he should have a freehold of £40 a year. James I., by his royal prerogative, conferred two members on the University of Oxford and the same number on that of Cambridge. All along till the revolution of 1688, efforts were made insidiously to reduce, or, if not, then at least to damage, the burgh representation. But in 1694, the 6 and 7 William and Mary, c. 2, enacted that Parliaments in future should be triennial, an alteration which much tended to render the House of Commons independent of the royal authority. A similar Act had been passed in 1641, but repealed in 1664. The Act 9 Queen Anne, c. 5, established a landed property qualification for members, whether for counties or boroughs, and by the 1st George I., passed in 1716, the Septennial Act was established which made the legal duration of a parliament seven instead of three years. It is still in force. At the beginning of the 18th century, England and Wales had 513 members of Parliament. The union with Scotland in 1707 added 30 county and 15 borough members to the House of Commons, that with Ireland on January 1, 1801, 64 for counties, 35 for cities, and one for Dublin University. This made up the entire representation of the United Kingdom to 658, a number which has since been nominally preserved, though the suspension of writs in individual constituencies for proved flagrant bribery has occasionally slightly reduced the number. For the sweeping changes of the distribution of political power produced in 1832 and 1867 by the transference of members from small and decaying places to important and rising burghs or sections of counties, see REFORM BILLS.

(*c*) *Present state:* A parliament cannot spring into life by any effort of its own: it requires to be summoned by the Sovereign. During an interregnum a Convention Parliament, sometimes called simply a Convention, can do so, and has done it twice in English history, once in 1660, the other time in 1688. [CONVENTION.] The persons entitled to appear as members of the House of Commons and of Parliament are those who have been elected by the registered electors of the several parliamentary constituencies, and have taken an oath or made an affirmation of loyalty, &c., in the normal way.

The House of Commons is presided over by a Speaker. [SPEAKER.] The first one, called Peter De La Mere, was elected in A.D. 1377. Most of the important legislation which emanates from the Imperial Parliament has its origin in the House of Commons. For the several stages through which a bill proposing some legislative change must pass before becoming law, see BILL and ACT. For the privileges of Members of Parliament, see MEMBERS. By the Septennial Act [1.] a Parliament which has escaped what may be termed a violent end, dies a natural death in seven years. [SEPTENNIAL.] A general election of representatives to serve in the new House of Commons, then takes place [ELECTION], and when a new Parliament assembles, the House of Lords, as an essential part of the complex machinery, is also summoned to meet. But few parliaments die a natural death. When the Ministry is defeated on what they deem a vital point, and they are of opinion that the country agrees with them and not with their adversaries, the Sovereign generally receives and acts upon the advice to dissolve Parliament, an act which formally submits to the judgment of the constituencies the disputed point which caused the ministerial crisis. [DISSOLUTION.] When a parliament only adjourns, on resuming its sittings, it takes up its business where it was left off, but when prorogued the Session is held to be at an end, and most of the business has to begin anew. [ADJOURNMENT, PARLIAMENT, PROROGATION.]

(2) *Subsequently*:

(*a*) Any assemblage of villagers or others united by common interests and under the same local government; a parish, a district.

(*b*) The commonalty, as opposed to the nobility.

2. *History*:

(1) The municipality of Paris, which, during the most sanguinary period of the first French Revolution, was the mouthpiece of the more ferocious revolutionaries. Under the old regime, power had been in the hands of the privileged classes, the king, the nobles, the higher ecclesiastics and other dignitaries, and their tyranny caused the revolution. Men of genius, chiefly from the middle classes, led the uprising at its commencement, and constituted the Girondist party, which, to gain the victory over the upper class, encouraged or even fomented revolts among the masses of the Parisian populace. The policy was successful for its primary object, but the demoniac spirit they had raised they could not again lay, and ultimately it was fatal to themselves. When, in 1792, it was believed that Austria and Prussia, which had invaded France, designed to force again on the nation the emigrant aristocrats thirsting for vengeance, the Legislative Assembly enacted that whenever it passed a vote that the country was in danger, every municipality should sit permanently. All ranks should arm, and those of them called to serve out of their native place should receive pay. The vote "The country is in danger" actually having taken place, the Municipality of Paris, which met at the Hotel de Ville, and had been formally constituted there on the 21st of May, 1791, began to sit in permanence. Subordinate councils were formed in each of the districts or sections of the city. These subordinate sections sent commissaries to the leading municipality, who, in place of aiding the old members in their deliberations, simply expelled them and usurped the power which they had wielded. Thus was constituted the celebrated Commune under whose auspices the Tuileries were captured, the Legislative Assembly and the Convention themselves domineered over, the Jacobin and other clubs of extreme politicians put in possession of all power in Paris and France, massacres of remorseless cruelty perpetrated, and the Reign of Terror inaugurated. Robespierre, Marat, and Danton became its leading spirits. Of this triumvirate Marat was assassinated on July 13, 1793, Danton guillotined on April 5, 1794; and when on July 28 Robespierre shared the same fate, having been captured the day before at the Hotel de Ville, the head-quarters of the Commune, the illegitimate domination of the latter came to an end, and Paris was soon afterwards, for safety's sake, divided into twelve municipalities instead of one.

(2) On March 18, 1871, an insurrection in Paris overthrew the Government, and an organisation, taking the name and prepared to carry out the traditions of the old revolutionary commune, was proclaimed on the 28th. Among its notable, not to say notorious deeds, were the burning of the Tuileries, the Hotel de Ville, and some other public buildings of historic interest. Four days afterwards, or on May 28, 1871, Paris was taken by storm, the commune fell, and many of the communards were either executed or transported.

II. *Technically:*

1. *Scrip.:* The appropriate rendering of the word κοινωνία (*koinōnia*) in 1 Cor. x. 16. The revisers retain the word communion, but place in the margin, "participation in." It seems to have a double reference: (1) Participation in "The cup of blessing which we bless, is it not a communion of [participation in] the blood of Christ: the bread which we break, is it not a communion of [participation in] the body of Christ." (2) The unity of those who participate: "... seeing that we who are many are one bread, one body, for we all partake of the one bread." In the margin: "Seeing that there is one bread, we, who are many, are one body."

2. *Theology:*

(1) The act of partaking with others of the sacramental symbols in the Lord's Supper. For the first three centuries the communion was administered every Lord's Day; then it became more infrequent, and before long was limited to Easter, Whitsunday, and Christmas. Many neglecting it even on these days, the Council of Lateran, in 1215, ordered all Catholics to communicate at least once a year, naming Easter as the time, an injunction which the Council of Trent confirmed. For the first seven centuries the practice was somewhat general of mixing water with the wine to symbolise the mystic union between Christ and the communicant's soul. Originally both bread and wine were administered, but in 1096, Pope Urban II. sanctioned the practice of omitting the wine when the communicant was a layman. This method the Council of Constance enjoined in 1414. It has since remained in force in the Church of Rome, but at the Reformation communion in both kinds, as it is often termed, was restored to the laity. The communion service of the Church of England was adopted in 1552.

(2) The community of belief, and theoretically at least, of Christian affection, existing among those who partake together of the Lord's Supper. *Communio* is used in this sense in

the canons of the Council of Elvira, A.D. 313. From this use of the Latin word is derived the practice of calling the several denominations, Communions, as the Lutheran Communion, the Wesleyan Methodist Communion, the Congregational Communion, &c.

*** cŏm-mūn'-ĭ-ŏn-ĭst,** *s.* [Eng. *communion*; *-ist.*] One who belongs to the same communion.

cŏm'-mụn-ĭzm, *s.* [Fr. *communisme.*]

1. A socialistic reconstruction of the body politic on the plan of abolishing private property, and transferring everything formerly possessed by individuals to the State, which then charges itself with the task of assigning work to each of the citizens, and dividing the profits among each. Communism of a certain modified type was advocated in Britain by Robert Owen in his "New View of Society," published in 1813. He attempted, without the assistance of any government, to found a society on the new model on the banks of the Wabash, in 1825, but the attempt failed. The United States have been the seat of numerous other communistic societies, including the Separatist Community, at Zoar, Ohio; the Harmony Society, near Pittsburgh; the Dunkers, at Ephrata, Pennsylvania; the Brook Farm Community, the Community of the Perfectionists, the Shakers, and others. The last named is in successful operation. St. Simon, Fourier, and Proudhon have been its leaders in France, and it seems working as a great unseen force in Germany and Russia. But no communistic society has yet been successful, though, in many cases, co-operative schemes have achieved the ends designed by their founders. [COMMUNITY, SOCIALISM.]

2. Support of the Parisian commune in its procedure at two periods of revolution. [COMMUNE (2).]

II. *Technically:*

1. *Her.: Arms of Community* are those borne by cities, towns, universities, colleges, abbeys, guilds, mercantile companies, &c.

2. *Socialism: Community of goods*, that is, the holding all goods in common, and the abolition of individual ownership, is advocated by many who wish to reconstruct society on a socialistic basis. It is believed to have existed in the early ages of the world, and in the first part of the apostolic age of Christianity. The view requires modification in both cases. In the first, Blackstone is of opinion that what existed in the earliest ages was a transient right of private property, that is, that one who first began to use anything acquired a brief right of proprietorship in it, which lapsed when he ceased to use it any longer. At the first rise of Christianity a near approach was made to the establishment of community of goods in the church, to cast what one had into the common treasury being the rule, to which there was scarcely an exception (Acts ii. 44, 45; iv. 32). But from Acts v. 4 we learn that this rule was not enjoined upon any one; each was free to retain his property for his own use if he pleased. [CHURCH HISTORY, COMMUNISM.]

¶ Blackstone thus distinguishes between a *law* or *rule*, and a *compact* or *agreement*: "'It [law] is also called a *rule* to distinguish it from a *compact* or *agreement*, for a *compact* is a promise proceeding from us, *law* is a command directed to us. The language of a *compact* is, 'I will or will not do this;' that of a *law* is, 'thou shalt or shalt not do it.' It is true there is an obligation which a *compact* carries with it, equal in point of conscience to that of a *law*; but then the original of the obligation is different. In *compacts* we ourselves determine and promise what shall be done before we are obliged to do it; in *laws* we are obliged to act without ourselves determining or promising anything at all. Upon these accounts law is defined to be a *rule*." (*Blackstone: Comment.*, bk. i., introd., § 2.)

B. *Technically:*

1. *Commerce:*

(1) A number of persons legally associated for the performance of any duty or the carrying on of any business. The profits are divided amongst the members or shareholders in proportion to the amount of capital invested.

¶ When the persons combining together for commercial enterprise are but few, the association is generally called a copartnery; but when many are thus united the name given is company. Thus no one ever thought of applying the term copartnery [COPARTNERY] to the late East India Company, or the Hudson's Bay Company. One division of companies is into exclusive or joint stock companies on the one hand, and open and regulated companies on the other. [JOINT STOCK.] In the former the enterprise is carried on by means of money previously raised by the sale of shares in the company to intending shareholders. The directors or those whom they employ manage the business; the shareholders do not trade with their part of the stock, but remain passive, except that they annually vote approval or the reverse of what has been done. Joint stock companies are divided into those of unlimited and those of limited liability. If a company of the former type fail, every shareholder is personally liable to the extent of all that he possesses for the debts which may have been incurred, with the expense of winding up. In a limited liability company again he is responsible only for any portion of his shares for which the money has not yet been called up.

"But there were some who held that our commerce with India would be best carried on by means of what is called a regulated *Company*."—*Macaulay: Hist. Eng.*, ch. xxiii.

(2) The partners in any firm whose names do not appear in the title or style of the firm; in this use the word is generally contracted to *Co.*

(3) A society, corporation, or guild for the promotion and protection of the interests of any trade.

¶ *Civic Companies or Corporations, specially those of London:*

(1) *Hist.:* Trade guilds are mentioned in some laws regulating the City of London which were made under King Athelstan in A.D. 939. Some centuries later, when the towns began to shake off the fetters of feudal oppression, the citizens or burgesses were divided into various trades or guilds which were made corporations, and had the political privileges accorded them of electing magistrates, and ultimately even members of parliament. These guilds either legitimately obtained or usurped the power of enacting bye-laws regulating the admission of new members, allowing none to enter them except they had first served a regular apprenticeship to the trade they desired to practice, and prohibiting any one not a member of their body from carrying on his trade within a corporate town. In France similar corporations long prevailed, and with abuses beyond any existing in England; but the whole system was swept out of existence by the first French Revolution.

The United States never established trade corporations, and in 1816, Albert Gallatin, Esq., Secretary to the Treasury of that Republic, boasted that "Industry is in every respect free and unfettered; every species of trade, commerce, profession, and manufacture, being equally open to all without requiring any regular apprenticeship, admission, or licence." At home the privileges of the trade companies were found oppressive, and some of their franchises were taken from them, so that at last they remained little more than charitable societies.

(2) *Present state:* London, the great seat of the old guilds now mentioned, has seventy-six of them still existing. They are known as the London City Livery Companies. To these there must be added three which have no livery, making seventy-nine in all. Some have ceased to exist. Among these is the Longbow Stringmakers' Company, but the Bowyers (*i.e.* Bowmakers) still continue. £25 is the sum which one must pay to be admitted to their livery. Twelve companies being regarded as higher in dignity than the others have the title "Honourable" prefixed to their designation. The following are the names with the dates at which they are believed to have first arisen:—1. The Mercers (A.D. 1393). 2. The Grocers (1345). 3. The Drapers (1439). 4. The United Fishmongers (1536). 5. The Goldsmiths (1327). 6. The Skinners (1327). 7. The Merchant Taylors (1416). 8. The Haberdashers (1447). 9. The Salters (1558). 10. The Ironmongers (1462). 11. The Vintners (1436). 12. The Clothworkers (1482).

For the political privileges of the Livery Companies, see CORPORATION. No correct knowledge is possessed of the revenues of the Companies. In 1869 it was stated at £99,027 from endowments, besides a sum unstated from other sources. Many believe that Parliament has the right to divert to more profitable uses the funds not now employed for the purpose for which they were originally raised; others take quite the opposite view, believing the money in question a kind of private property. A struggle between these antagonistic views is certain to occur.

2. *Mil.:* The smallest command of a captain of infantry. In the United States an infantry battalion consists of two or more companies, each officered by a captain, a first and a second lieutenant, five sergeants, and four corporals. In times of war a full company consists of 101 men and officers; in times of peace of 3 commissioned officers and 54 men. It is formed in two ranks. In England it forms one-eighth of a war battalion, and has little independent action; on the Continent the company, which is one-fourth of the war battalion, acts almost independently. In England the war strength of a company is 120, and the captain is unmounted; in the Continental armies it is 250. In Germany it is formed in three ranks, and the captain is mounted.

2. *Science:* When human anatomy had been brought a certain distance towards perfection, attention was given to the anatomy of the superior animals, Cuvier leading the way. The corresponding parts of the several animals being naturally compared together with the view of tracing their resemblances and their variations, the science was called Comparative Anatomy. The same method was tried next, and with good results, on philology, and the science of comparative philology arose. It was then extended to mythology, and finally to the religions of the world.

3. *Magnetism:* An instrument for determining horizontal direction by means of a poised magnetic needle. There are many kinds of it; the best known is the mariner's compass. [4.]

4. *Naut.:* The mariner's compass, which is a declination compass used in guiding the course of a ship. It is generally enclosed in a box, which again is placed in another and larger one, the latter termed the binnacle, the appropriate situation of which is the deck in the after part of the vessel. The magnetised needle, which is the essential part of the mariner's compass, is fixed to the lower part of a card, which may be made of ordinary cardboard, of a leaf of mica, or anything similar. By this arrangement, which is the most convenient one, the card revolves with the needle. It is marked not merely with the four cardinal points, but with various minuter divisions so as to constitute 32 in all. To keep the compass in a horizontal position, notwithstanding the rolling of the ship, it is supported on gimbals. In an iron or steel vessel there is a deviation of the north and south line from the magnetic meridian, owing to the permanent magnetism of such a vessel. This is compensated for by placing a permanent steel magnet in the neighbourhood of the compass, which exerts an equal and opposite couple to that due to the ship. It is believed that the mariner's compass was in use in China first on land and then, after an interval, to guide ships on the sea. The name of its inventor has not been preserved. Nor is it known who introduced it into Europe, or when. Guyot de Provins, a French poet, who in A.D. 1190 wrote a satire called "La Bible," speaks of it, but having been a crusader he may have seen it in the East. If it had reached the West, it was scarcely known when he wrote, but about 1250 it began to be appreciated, and soon after came into general use.

¶ *Azimuth Compass:* [AZIMUTH.]

Declination Compass: An instrument intended to measure the magnetic declination of a place, when its astronomical meridian is known.

Sine Compass:

Elect.: A form of galvanometer for measuring powerful currents.

Tangent Compass:

Elect.: An instrument for measuring the intensity of a voltaic current in which a small needle is placed. The intensity of such a current being proportional to the angle of deflection, the instrument ascertains this deflection, after which its corresponding value is obtained from a table of tangents, and thus the intensity of the current is measured.

¶ Crabb thus discriminates between to *compel*, to *force*, to *oblige*, and to *necessitate*: "*Compulsion* and *force* act much more directly and positively than *oblige* or *necessitate*; and the latter indicates more of physical strength than the former. We are *compelled* by outward or inward motives; we are *obliged* more by motives than any thing else; we are *forced* sometimes by circumstances, though oftener by plain strength; we are *necessitated* solely by circumstances. An adversary is *compelled* to yield who resigns from despair of victory; he is *forced* to yield if he stand in fear of his life; he is *obliged* to yield if he cannot withstand the entreaties of his friends; he is *necessitated* to yield if he want the strength to continue. An obstinate person must be *compelled* to give up his point; a turbulent and disorderly man must be *forced* to go where the officers of justice choose to lead him; an unreasonable person must be *obliged* to satisfy a just demand; we are all occasionally *necessitated* to do that which is not agreeable to us." † 1. The act of rendering an equivalent for.

2. That which constitutes an equivalent for something else.

(1) *Lit.:* That which is given or received as an equivalent for services rendered, losses sustained, sufferings endured, or in payment of a debt; amends, remuneration, payment, recompense.

". . . partly as a *compensation* for their recent losses."—*Macaulay: Hist. Eng.*, ch. xvi.

(2) *Fig.:* That which balances or is an equivalent for something else, or makes good a deficiency.

II. *Law:*

1. *Gen.:* The same as A. I. (1).

2. *Spec.:* A stoppage or set-off. When one is sued for a debt, it is competent for him, partially or wholly, to bar the claim, by alleging that he is the plaintiff's creditor for services rendered or money lent. If the sum claimed from the plaintiff is found to be the exact equivalent of that for which he sues, the two are held to compensate or balance each other; if, on the contrary, it be less, it diminishes by so much the prosecutor's claim. If, however, the defendant feel that he owes the plaintiff more than that individual is indebted to him, he is required at the outset to pay into court the smaller sum for which he admits himself to be responsible. (*Blackstone: Comment.*, bk. iii., ch. xx.)

¶ Crabb thus distinguishes between *compensation, satisfaction, amends, remuneration, recompense, requital,* and *reward.* "The first three of these terms are employed to express a return for some evil; *remuneration, recompense,* and *requital,* a return for some good; *reward,* a return for either good or evil. A *compensation* is something real; it is made for some positive injury sustained; justice requires that it should be equal in value, if not like in kind, to that which is lost or injured: a *satisfaction* may be imaginary, both as to the injury and the return; it is given for personal injuries, and depends on the disposition of the person to be *satisfied*: *amends* is real, but not always made for injuries done to others, as for offences committed by ourselves. Sufferers ought to have a *compensation* for the injuries they have sustained through our means, but there are injuries, particularly those which wound the feelings, for which there can be no *compensation*: tenacious and quarrelsome people demand *satisfaction*; their offended pride is not *satisfied* without the humiliation of their adversary: an *amends* is honourable which serves to repair a fault; the best *amends* which an offending person can make is to acknowledge his error, and avoid a repetition . . . *Compensation* is made for bodily labour and menial offices; *remuneration* for mental exertions, for literary, civil, or political offices . . . A *recompence* is voluntary, both as to the service and the return; it is an act of generosity . . . *Requital* is a return for a kindness; the making it is an act of gratitude; the omission of it wounds the feelings: it sometimes [though not often] happens that the only *requital* which our kind action obtains, is the animosity of the person served." (*Crabb: Eng. Synon.*)

B. *As adj.:* (See the compounds).

compensation balance, *s.*

Hor.: A balance-wheel for a watch or chronometer, so constructed as to make isochronal (equal time) beats, notwithstanding changes of temperature. (*Knight.*)

compensation pendulum, *s.*

Hor.: A pendulum constructed of two different metals, as brass and iron, which so work against each other, that the expansion of the one downwards is counteracted by that of the other upwards. By this arrangement the pendulum does not vary in length, and consequently in frequency of vibration, whatever the temperature may be. *Arnold's compensation balance-wheel* for chronometers and watches is constructed on a similar principle.

compensation strips, *s. pl.* Two blades of copper and iron soldered together and fixed to the rod of a pendulum, the copper rod, which is the more expansible, being below the iron. As the temperature falls, the pendulum rod becomes shorter, but the strips, if in their normal state horizontal, now curve with the convex portion upwards. If again the temperature rises, the pendulum ball descends, but the strips, which now curve with their convexity downward, make a compensation for this. Both in the former case and in that now described, the centre of oscillation of the pendulum is not disturbed. Compensation strips are called also *compensating* strips. (*Ganot: Physics*, transl. by Atkinson, § 271.)

I. *Ordinary Language:*

1. *Gen.:* Sufficiency.

"Something of speech is to be indulged to common civility, more to intimacies, and a *competency* to those recreative discourses which maintain the cheerfulness of society."—*Government of the Tongue.*

2. *Spec.:* Adequate pecuniary support, remote at once from want and from superfluity.

"He obtained from the royal bounty a modest *competence*; and he desired no more."—*Macaulay: Hist. Eng.*, ch. xiii.

II. *Law:*

1. *Of persons:*

(1) Legal ability or permission by law to act in a certain capacity. Thus the competence of a judge or a court to try a cause means that the cause is fairly within the jurisdiction of the judge or court, and the competence of a witness to give evidence means his legal capacity to do so. This depends on his not being challenged as infamous in character or personally interested in the case. (*Blackstone: Comment.*, bk. iii., ch. 23.)

(2) Legal capacity to do any act, as to make a will. It depends on age, soundness of mind, &c.

2. *Of evidence:* Admissibility.

cŏm'-pĕ-tent, * **cŏm'-pĕ-tĕnte,** *a.* [Dan. *competent*; Ger. *kompetent*; Fr. *compétent*; Sp., Port., & Ital. *competente*, from Lat. *competens*, pr. par. of *competo.*] [Compete.]

I. *Ordinary Language:*

1. Suitable, fit.

4. *Of persons:* Qualified for any purpose or office; having physical, mental, or moral ability to do certain things or to occupy a certain place.

"Her father was perfectly *competent* to take care of himself."—*Macaulay: Hist. Eng.*, ch. xvi.

"... the *competent* mathematician of that day could predict what is now occurring in our own."—*Tyndall: Frag. of Science* (3rd ed.), iii. 64.

II. *Law:*

1. *Of evidence:* Admissible in a law court.

2. *Of persons:* Legally qualified to do any particular thing or to fill any specified office.

"And he was *competent* whose purse was so."
Cowper: Task, ii. 742.

¶ Crabb thus distinguishes between *competent*, *fitted*, and *qualified*: "*Competency* mostly respects the mental endowments and attainments; *fitness* the disposition and character; *qualification* the artificial acquirements or natural qualities. A person is *competent* to undertake an office; *fitted* or *qualified* to fill a situation. Familiarity with any subject, aided by strong mental endowments, gives *competency*; suitable habits and temper constitute the *fitness*; acquaintance with the business to be done, and expertness in the mode of performing it, constitute the *qualification*." (*Crabb: Eng. Synon.*)

cŏm-pĕ-tĕn'-tēş, *s. pl.* [Lat. *competentes*, pl. of *competens*, pr. par. of *competo*.] [COMPETE.]

"The flesh is either *competently* dry . . . or moyst and excrementitial."—*Venner: Via Recta*, p. 92.

*** cŏm-pĕt'-ĭ-ble,** *a.* [From Lat. *competo* = to seek together.] Suitable to, consistent with, able to be predicated of, applicable to.

(1) Followed by *with:*

"It is not *competible with* the grace of God so much as to incline any man to do evil."—*Hammond.*

(2) Followed by *to:*

"The duration of eternity is such as is only *competible to* the Eternal God."—*Sir M. Hale.*

¶ Its place has been taken by COMPATIBLE (q.v.).

*** cŏm-pĕt'-ĭ-ble-nĕss,** *s.* [Eng. *competible*; *-ness.*] Suitableness, fitness. [COMPATIBLENESS.]

"... would increase immensely in numbers, were it not for other *competing* species . . ."—*Darwin: Origin of Species* (ed. 1859), ch. vi., p. 175.

cŏm-pĕ-tĭ'-tion, *s.* [Sp. *competicion*; Port. *competição*; from Lat. *competitio* = (1) an agreement, (2) a judicial demand, from *competo*.] [COMPETE.]

I. *Ordinary Language:*

1. The act of endeavouring to gain what another attempts to gain at the same time, and which as a rule only one can enjoy.

"To scenes where *competition*, envy, strife,
Beget no thunder-clouds to trouble life."
Cowper: The Valediction.

¶ (1) *Competition* was formerly followed at times by *to:*

"... *competition to* the crown."—*Bacon.*

(2) Now *for* is used of the object striven for, and *to* or *amongst* of those who strive.

"... might well have been an object of *competition to* sovereigns . . ."—*Macaulay: Hist. Eng.*, ch. ix.

¶ An *open* competition for an appointment is a competition open to any one fulfilling certain qualifications who thinks fit to present himself. It is opposed to the more limited competition which takes place when only nominees of some person or office can enter.

2. The state of existing in permanent rivalry with another person or with another species. It may be used of all animated beings.

"For it should be remembered that the *competition* will generally be most severe between those forms which are most nearly related to each other in habits, constitution, and structure."—*Darwin: Origin of Species* (ed. 1859), ch. iv., p. 121.

II. *Polit. Econ.:* The struggle which each one makes for his own interest against that of others. A shopman, for instance, tries to draw customers around him by underselling his rivals. Such competition tends to fix the price of articles as low as the law of supply and demand will permit. When there is no adulteration, use of short weights, or other fraud, it is of great benefit to the public.

¶ Crabb thus distinguishes between *competition*, *emulation*, and *rivalry*: "*Competition* expresses the relation of a competitor, or the act of seeking the same object; *emulation* expresses a disposition of the mind towards particular objects; *rivalry* expresses both the relation and the disposition of a rival. *Emulation* is to *competition* as the motive to the action; *emulation* produces *competitors*, but it may exist without it: they have the same marks to distinguish them from *rivalry*. *Competition* and *emulation* have honour for their basis; *rivalry* is but a desire for selfish gratification. A *competitor* strives to surpass by honest means; he cannot succeed so well by any other: a *rival* is not bound by any principle; he seeks to supplant by whatever means seem to promise success. An unfair *competitor* and a generous *rival* are equally unusual and inconsistent. *Competition* animates to exertion; *rivalry* provokes hatred: *competition* seeks to merit success; *rivalry* is contented with obtaining it." (*Crabb: Eng. Synon.*)

cŏm-pĕt'-ĭ-tĭve, *a.* [From Lat. *competitus*, pa. par. of *competo* = to seek together; and Eng. suff. *-ive.*] Pertaining to competition, involving competition. (*H. Martineau.*)

*** 1.** An associate, one struggling not against but in alliance with another.

"And every hour more *competitors*
Flock to the rebels, and their power grows strong."
Shakesp.: Richard III., iv. 4.

2. A person who competes; one who engages in a struggle mental, physical, or both with a rival, to become the sole possessor of some desirable object at which both aim.

"... some of his servants were in correspondence with his *competitor* . . ."—*Macaulay: Hist. Eng.*, ch. xviii.

¶ It may be used also of animals or of species severally.

"... the number of species of all kinds, and therefore of *competitors*, decreases northwards."—*Darwin: Origin of Species* (ed. 1859), ch. iii., p. 69.

¶ Crabb thus discriminates between *to complain, to lament,* and *to regret:* "We *complain* of our ill health, of our inconveniences, or of troublesome circumstances; we *lament* our inability to serve another; we *regret* the absence of one whom we love. Selfish people have the most to *complain* of, as they demand most of others, and are most liable to be disappointed; anxious people are the most liable to *lament*, as they feel every thing strongly; the best regulated mind may have occasion to *regret* some circumstances which give pain to the tender affections of the heart."

He thus discriminates between *to complain, to murmur,* and *to repine:* "The idea of expressing displeasure or dissatisfaction is common to these terms. *Complaint* is not so loud as *murmuring*, but more so than *repining*. We *complain* or *murmur* by some audible method; we may *repine* secretly. *Complaints* are always addressed to some one; *murmurs* and *repinings* are often addressed only to one's self. *Complaints* are made of whatever creates uneasiness, without regard to the source from which they flow; *murmurings* are a species of *complaints* made only of that which is done by others for our inconvenience; when used in relation to persons, *complaint* is the act of a superior; *murmuring* that of an inferior; *repining* is always used in relation to the general disposition of things." So that the characteristic idea of *completing* is the conducting a thing to its final period; that of *finishing*, the arrival at that period; and that of *terminating* the cessation of a thing. *Completing* has properly relation to permanent works only, whether mechanical or intellectual; we desire a thing to be *completed* from a curiosity to see it in its entire state. To *finish* is employed for passing occupations; we wish a thing *finished* from an anxiety to proceed to something else, or a dislike to the thing in which we are engaged. *Terminating* respects discussions, differences, and disputes. B. *Ethn.:* In the same sense as A. I. 2. Dr. Prichard arranges the complexions of the several varieties of man under three types:—

(1) The Melanocomous or Black-haired type. It varies greatly in the depth of its hue, from the intense black of the negro, through the dark red of the American Indian to the brownish yellow colour, improperly called olive, of the Eastern Asiatic, its extreme being the slightly dark tinge of the black-haired individuals or tribes of Europe.

(2) The Xanthous, or Yellow-haired type. The hair, nominally yellow, may also be light brown, auburn, or red. The skin is fair, the eyes blue or grey. The majority of the Teutonic race, including the English, are of this type. It may spring up anywhere among the Black-haired races of men, and does so when these are subjected for generations to cold. Thus there are fair-haired blue-eyed Jews, Afghans, &c.

(3) The Leucous or Albino, with the absence of colouring matter in the hair and eyes, the former being fleecy white, the latter pink. It exists sporadically in hot countries, among the dark-haired races of mankind, and is a morbid rather than a healthy state of the bodily frame. A strictly analogous change is seen in several of the lower animals. [ALBINO.]

Complexity* arises from a multitude of objects, and the nature of these objects; *complication* from an involvement of objects; and *intricacy* from a winding and confused involution. What is *complex* must be decomposed; what is *complicated* must be developed; what is *intricate* must be unravelled. A proposition is *complex; affairs* are *complicated;* the law is *intricate. Complexity* puzzles; *complication* confounds; *intricacy* bewilders." (*Crabb: Eng. Synon.*)

* 3. Agreement, suitability, accord (followed by the prep. *to*).

". . . in *compliance* to their characters . . ."—*Pope: Homer's Odyssey: Postscript.*

¶ Crabb thus discriminates between *compliance, conformity, yielding,* and *submission*: "*Compliance* and *conformity* are voluntary; *yielding* and *submission* are involuntary. *Compliance* is an act of the inclination; *conformity* an act of the judgment: *compliance* is altogether optional; we *comply* with a thing or not at pleasure: *conformity* is binding on the conscience; it relates to matters in which there is a right and a wrong. *Compliance* and *conformity* are produced by no external action on the mind; they flow spontaneously from the will and understanding: *yielding* is altogether the result of foreign agency." Bot.: An order of plants, founded in 1751 by Linnæus, and adopted in 1763 by Adanson. It contains many plants separated from others by characters so obvious that it still stands with essentially the same limits as those assigned it in the infancy of botany. Lindley altered the name of the order to Asteraceæ. For its characters see ASTERACEÆ. De Candolle, Lindley, &c., divided it thus—Sub-order 1, Tubulifloræ: Tribe (1) Vernoniaceæ, (2) Eupatoriaceæ, (3) Asteroideæ, (4) Senecioideæ, (5) Cynareæ. Sub-order 2, Labiatifloræ: Tribe (1) Mutisiaceæ, (2) Nassauviaceæ. Sub-order 3, Ligulifloræ: Tribe Cichoraceæ. The eight tribes now mentioned were first properly discriminated by Lessing, who showed that each had a different stigma.

Whatever is not seen is *concealed,* but whatever is *hidden* or *secreted* is intentionally put out of sight: a person *conceals* himself behind a hedge; he *hides* his treasures in the earth; he *secretes* what he has stolen under his cloak. *Conceal* is more general than either *hide* or *secrete:* all things are *concealed* which are *hidden* or *secreted,* but are not always *hidden* or *secreted* when they are *concealed.* Both mental and corporeal objects are *concealed;* corporeal objects mostly and sometimes mental ones are *hidden;* corporeal objects only are *secreted:* we *conceal* in the mind whatever we do not make known; that is *hidden* which may not be discovered or cannot be discerned; that is *secreted* which may not be seen. ¶ Crabb thus discriminates between *to conceive, to apprehend, to imagine*, and *to suppose*: "*Conceive*, in the strict sense of the word, is the generic, the others the specific terms: since in *apprehending*, *imagining*, and *supposing*, we always *conceive* or form an idea, but not *vice versâ*; the difference consists in the mode and object of the action: we *conceive* of things as proper or improper, and just or unjust, right or wrong, good or bad, this is an act of the judgment; we *apprehend* the meaning of another, this is by the power of simple perception, or of combination and reflection; we *suppose* or *imagine* that which has happened or may happen."

He thus discriminates between *to conceive, to comprehend*, and *to understand*: "*Conception* is the simplest operation of the three; when we *conceive* we may have but one idea, when we *understand* or *comprehend* we have all the ideas which the subject is capable of presenting. We cannot *understand* or *comprehend* without *conceiving*; but we may often *conceive* that which we neither *understand* nor *comprehend*. That which we cannot *conceive* is to us nothing; but the *conception* of it gives it an existence, at least in our minds; but *understanding* and *comprehending* is not essential to the belief of a thing's existence. So long as we have reasons sufficient to *conceive* a thing as possible or probable, it is not necessary either to *understand* or *comprehend* them in order to authorize our belief. The mysteries of our holy religion are objects of *conception* but not of *comprehension*. We *conceive* that a thing may be done without *understanding* how it is done; we *conceive* that a thing may exist without *comprehending* the nature of its existence. We *conceive* clearly, *understand* fully, *comprehend* minutely. *Conception* is a species of invention; it is the fruit of the mind's operation within itself. *Understanding* and *comprehension* are employed solely on external objects; we *understand* and *comprehend* that which actually exists before us, and presents itself to our observation. *Conceiving* is the office of the imagination, as well as the judgment; *understanding* and *comprehension* are the office of the reasoning faculties exclusively." B. *Chem.:* A process which has for its object to increase the amount of a dissolved substance in a liquid, relatively to the quantity of the solvent, without adding any more of the dissolved substance itself. When the solvent is volatile this object is effected by evaporation, as when water, alcohol, or ether is expelled from a solution by heat, by exposure to the air, or *in vacuo*. If the dissolved substance is more volatile than the solvent, the concentration is effected by distillation, the more concentrated liquid being then found in the distillate, as in the rectification of hydrated alcohol and of volatile oils dissolved in water. In the case of aqueous liquids, concentration is sometimes effected by freezing out the water; in this manner a strong solution of salt may be obtained from sea water; strong spirit from vinous liquids, &c. A similar principle is applied to the separation of silver from lead. The argentiferous lead is melted and left to cool till about two-thirds of the mass is solidified. This consists of nearly pure lead, the portion which still remains liquid being an alloy richer in silver than the original mass. By repeating this operation several times the alloy at last becomes sufficiently rich in silver to be treated by cupellation. (*Watts: Dict. Chem.*, vol. i., p. 1107.)

2. *Mental Phil.:*

(1) The cognition of classes, as distinguished from individuals; that special application of abstraction, comparison, and attention which elaborates what logicians call notions or concepts; the act of the mind in producing concepts or notions.

(2) The notions or concepts so produced; the "general" or "abstract ideas" of Locke; the "abstract general notions" of Hamilton. These are properly expressed by common terms, and constitute the object of study in pure or formal logic. The number of attributes embraced in a concept or notion constitutes its intension, comprehension, or logical content, and this determines its area or sphere of applicability, that is, its extension or logical extent. These two quantities exist in an inverse ratio to one another. The maximum of the extent of a conception or notion is the minimum of the content, and the maximum of the content is the minimum of the extent. On this single maxim Pure or Formal Logic has been based. (*Kant, Sir Wm. Hamilton, Prof. Campbell Fraser*, Edinburgh University.)

Dugald Stewart used conception as equivalent to reproductive imagination, and Reid used it as convertible with imagining, understanding, or comprehending.

"*Imagining* should not be confounded with *conceiving*, &c., though some philosophers, as Gassendi, have not attended to the distinction. The words, *conception, concept, notion*, should be limited to what cannot be represented in the imagination, as the thought suggested by a general term. The Leibnitzians call this *symbolical* in contrast to *intuitive* knowledge. This is the sense in which *conceptio* and *conceptus* have been usually and correctly employed. Mr. Stewart, on the other hand, arbitrarily limits *conception* to the reproduction, in imagination, of an object of sense as actually perceived."—*Sir Wm. Hamilton's Note on Reid, The Intellectual Powers*, p. 360.

"The term *conception*, which means a taking up in bundles and grasping into unity, ought to have been left to denote, what it previously was, and only properly could be, applied to express—the notions we have of classes of objects, in other words, what have been called our *general ideas*."—*Sir Wm. Hamilton: Metaphysics*, p. 262, vol. ii.

". . . abstract *conceptions* are impossible."—*Herbert Spencer* (2nd ed.), vol. ii., p. 525, § 487.

"The close of all Albert the Great's intense labours, of his enormous assemblage of the opinions of the philosophers of all ages, and his efforts to harmonize them with the high Christian theology, is a kind of eclecticism, an unreconciled realism, *conceptualism*, nominalism, with many of the difficulties of each."—*Milman: Hist. of Lat. Christianity*, bk. xiv., ch. iii.

Cŏn-çĕp'-tu-ą-lĭst, *s. & a.* [Eng. *conceptual(ism); -ist.*]

A. *As substantive:*

Metaph. & Hist. (*pl.*): A metaphysical sect—if, indeed, it had coherence enough to be called a sect—which arose in the Middle Ages during the disputes between the Nominalists and the Realists. It sought to occupy an intermediate position between the two contending parties, but it approximated much more nearly to the Nominalists than to the Realists; perhaps, indeed, it was not really distinct from the former. The Realists held that general ideas, such as genus, species, &c., called in the language of the schoolmen universals, are real existences, at least in the Divine mind; the Nominalists, on the contrary, contended that they were mere names or words, while the Conceptualists held that they were not only names but mental conceptions or ideas. The Conceptualists were not able to make their voice very audible in Mediæval times amid the din of battle between the greater combatants, but the eminent metaphysician Locke held views essentially conceptualist.

B. *As adj.:* Pertaining to the tenets of the metaphysicians described under A.

Zool.: In De Blainville's arrangement a family of Molluscs, comprehending among other genera Cardium, Donax, Tellina, Mactra, &c. The first, third, and fourth of these are now the types of distinct families, and Donax is ranked under the Tellinidæ. The term Conchaceæ is, therefore, no longer required, and has ceased to be used.

"*Conchifers* [are] shell-fish; usually restricted to those with bivalve shells."—*Owen: Comp. Anat.*, gloss.

2. *Pl.:* The English designation of the class Conchifera (q.v.).

cŏnch-ĭf'-ĕr-a, *s.* [Lat. *concha* = a conch, *i* connective, and *fero* = to bear.]

1. *Zool.:* Lamarck's designation now generally adopted for the great class of Mollusca containing the species which possess ordinary bivalve shells. Cuvier arranged the Conchifera with Salpa and other naked molluscs into a class Acephala—*i.e.*, Headless Animals—so called because they have no apparent head, but a mere mouth concealed in the bottom or between the folds of their mantle. He placed them in an order Acephala Testacea, distinguishing their shelless associates as Acephala Nuda. From their possessing four branchial lamellæ or leaflets, De Blainville called them Lamellibranchiata, a name still much in use; it is the designation Professor Huxley retains for the class. Their body is included within a mantle or pallium, formed by a prolongation of the dorsal integuments; there is a well-developed heart, generally with two auricles and one ventricle, or with one of each or even two of each. Some have a conspicuous foot. They have bivalve shells of the normal type, which as a rule have the right and left valves nearly of the same size and shape, and both more or less inequilateral, the anterior being much shorter than the posterior side. This distinguishes them from the Brachiopoda, in which the bivalve shells are as a rule unequal in size, but each singly equilateral. [Brachiopoda.] The valves of a Conchifer are bound together by an elastic ligament, and are jointed by a hinge furnished with interlocking teeth. Near each hinge is an umbo, *i.e.*, a boss or beak, which was the point whence the growth of the shell originally took place. The length of a valve is measured from the anterior to the posterior side, its breadth from the dorsal margin to the base, its thickness from the centre of the closed valves. Bivalve shells are said to be shut when the valves fit exactly, and gaping when they cannot be completely shut; the outer side has often ribs radiating from the umbo to the margin or concentric ridges. Inside the margin of the shell on which the ligament and teeth are situated is the hinge-line. The adductor muscles, the foot and byssus, the siphons, and the mantle, all leave muscular impressions.

2. *Palæont.:* Fossil bivalves are found in most sedimentary rocks. They are somewhat rare in the earlier formations, but go on to increase through the Secondary and Tertiary Periods, reaching their maximum in the present seas. They are seven times more numerous in the Newer Tertiary than in the oldest geological systems. (*S. P. Woodward.*)

cŏn-chĭf'-ĕr-oŭs, *a.* [Lat. *concha* (q.v.), *i* connective, *fero* = to bear, and Eng. adj. suff. *-ous.*] Bearing a shell. (*Pen. Cycl.*)

It contains 50 per cent. of carbon, 6 of hydrogen, and about 16 per cent. of nitrogen. By long boiling with dilute sulphuric acid it yields leucin.

*** cŏnch'-īte,** *s.* [Fr. *conchite*; Gr. κόγχη (*kongchē*) = a conch (q.v.), and suff. *-ite* (*Paleont.*) (q.v.).] A fossil "conch," or similar shell. [Conch.] The modern palæontologist does not need the term; he attempts, generally with success, to ascertain the genus and species of any fossil shell he may find, or, if it is new to science, gives it a name.

cŏnch-ĭt'-ĭc, *a.* [Eng. *conchit(e)*; *-ic.*] Composed of or largely containing shells.

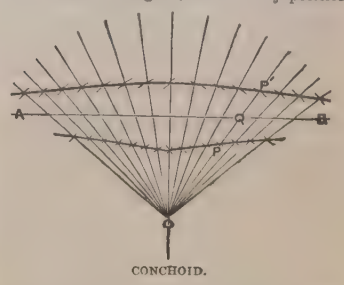
cŏnch'-ŏĭd, *s.* [Ger., Fr., & Port. *conchoide*; Gr. κογχοειδής (*kongchoeidēs*) = of the mussel kind; κόγχη (*kongchē*) = a shell; and εἶδος (*eidos*) = form.]

Geom.: A curve discovered by Nicomedes in the second century A.D., and used by him for the finding of two mean proportionals. If a straight line always passes through a fixed point O, and a point Q, fixed into the revolving line, always moves along the line A B, then any point P in the revolving line always at the same distance from Q will trace out a conchoid. And, since the length Q P can in any position



CONCHOID.

of the revolving line be measured either towards or from O, it is evident that, corresponding to any given length assigned to Q P, two conchoids can be described, one above and the other below the line A B. These are known as the superior and inferior conchoids. Moreover, with a given point O and a given straight line A B, any number of pairs of different conchoids can be described by varying the length Q P. Moreover, the shapes of all such curves will vary according to the length of Q P. Thus, if Q P is less than the perpendicular from O on A B, the shape is as given in the adjoining figure, and the isolated point O is also a point on the curve.

cŏnch-ŏĭ'-dal, *a.* [Eng. *conchoid*; *-al.*]

Min.: Presenting a surface more or less like the surface of a shell. Used of the fracture of minerals when they so break as to present on one fragment a concave surface like that of the interior of a bivalve shell, and on the other a convex one, like its exterior. There are varieties of it—viz., imperfectly, and again perfectly, large, small, and flat conchoidal. (*Phillips.*)

cŏnch-ŏ-lŏg'-ĭ-cal, *a.* [Gr. κόγχη (*kongchē*) = a shell-fish; λόγος (*logos*) = a discourse; and Eng. suff. *-ical* (q.v.).] Relating to or in any way connected with conchology.

cŏnch-ŏl'-ŏ-ġist, *s.* [Eng. *conchol(ogy)*; *-ist.*]

1. *Ord. Lang.:* One who studies or is versed in conchology.

2. *Zool.:* A name given to the carrier shells, from their often attaching shells to the margins of their whorls as they grow. (*Ogilvie.*)

cŏnch-ŏl'-ŏ-ġy, *s.* [Gr. κόγχη (*kongchē*) = a muscle or cockle, and λόγος (*logos*) = a discourse.] The science of shells. Two well-marked stages in its development are traceable. At first shells were studied without any reference to the animals of which they constituted the hard framework or skeleton. Subsequently the study took a wider scope, and for the first time became worthy of being called a science, when the animals and their shells were viewed as parts of one common whole. When shells were looked upon as little more than ornamental objects, those who studied conchology were not generally of a high order of intellect; but since the rise of geology and the discovery that of all fossils shells are able to furnish the most definite information regarding the several strata, and consequently regarding the history of bygone time, scientific minds of the very first class have given keen attention to shells. Some of these belonging to land animals, others to those

inhabiting fresh water, and the great majority to those which are marine, the fossil shells in a stratum constantly enable the geologist to ascertain whether a stratum is the remains of a land surface, or a deposit from fresh water, or the bed of a sea. Particular genera and species flourish at certain fixed depths, and when the geologist finds analogous fossil shells, he is able, startling as it may appear, within certain limits to sound the depths at particular spots of a primeval and now long departed sea.

When shells, and shells alone, were studied, conchology was a not unsuitable name, except that the termination *-ology* suggested that the investigation was more scientific than in most cases it really was. When the animals came to be carefully examined, M. de Blainville proposed for this deeper study the name Malacozoology—*i.e.*, the study of the softer animals—viz., Molluscs; this has been since abbreviated into Malacology. As each of the terms Conchology and Malacology refers to only half the inquiry, we have avoided both, and, unless in exceptional cases, described Molluscs and their shells under the heading Zoology.

"Her affability had *conciliated* many who had been repelled by his freezing looks and short answers."—*Macaulay: Hist. Eng.*, ch. xxi.

¶ Crabb thus discriminates between *conciliate* and *reconcile:* "*Conciliate* and *reconcile* are both employed in the sense of uniting men's affections, but under different circumstances. The *conciliator* gets the good will and affections for himself; the *reconciler* unites the affections of two persons to each other. The *conciliator* may either gain new affections, or regain those which are lost; the *reconciler* always renews affections which have been once lost. The best means of *conciliating* esteem is by *reconciling* all that are at variance. *Conciliate* is mostly employed for men in public stations; *reconcile* is indifferently employed for those in public or private stations. Men in power have sometimes the happy opportunity of *conciliating* the good will of those who are most averse to their authority, and thus *reconciling* them to measures which would otherwise be odious. Kindness and condescension serve to *conciliate;* a friendly influence, or a well-timed exercise of authority, is often successfully exerted in *reconciling.*" (*Crabb: Eng. Synon.*)

II. *Eccles.:* For the two senses in which the term conclave is used, see I. 1, 2. Pope Nicolaus II., in the eleventh century, and Alexander III., in the twelfth, having limited the right of electing a pope to the college of cardinals, in 1268, on the death of Clement IV., the electors could not for nearly three years agree upon a successor; and in 1271 the magistrates, acting on the advice of St. Bonaventura, locked them up till they could agree, which confinement made them do before long. The success of the scheme led to its becoming a settled institution, and it still continues. The appropriate place for shutting up the cardinal electors is a range of small cells in the Vatican, or some other pontifical palace, though a conclave may be held elsewhere; thus Pius VII. was elected at Venice. Formerly the practice was to limit the electors to a single dish at dinner and the same at supper if they did not agree within three days, and to a small allowance of bread, water, and wine, if the eighth day saw their deliberations still unfinished. Gregory XV. regulated the conclave by a bull issued in 1621, and Urban VI. by one sent forth in 1625.

¶ Crabb thus discriminates between *conclusion*, *inference*, and *deduction*: "A *conclusion* is full and decisive; an *inference* is partial and indecisive; a *conclusion* leaves the mind in no doubt or hesitation; it puts a stop to all farther [further] reasoning: *inferences* are special *conclusions* from particular circumstances; they serve as links in the chain of reasoning. *Conclusions* are drawn from real facts; *inferences* are drawn from the appearances of things; *deductions* only from arguments or assertions. *Conclusions* are practical; *inferences* ratiocinative; *deductions* are final. We *conclude* from a person's conduct or declarations what he intends to do or leave undone; we *infer* from the appearance of the clouds, or the thickness of the atmosphere, that there will be a heavy fall of rain or snow; we *deduce* from a combination of facts, *inferences*, and assertions that a story is fabricated." ¶ *Conclusive evidence* (*Law*): Evidence of which from its very nature the law admits of no controversy or contradiction.

Conclusive presumption: An inference or presumption which no proof, however strong, can be admitted to contradict or invalidate.

¶ Crabb thus discriminates between *conclusive*, *decisive*, and *convincing*: "It is necessary to be *conclusive* when we deliberate, and *decisive* when we command. What is *conclusive* puts an end to all discussion, and determines the judgment; what is *decisive* puts an end to all wavering, and determines the will. Negotiators have sometimes an interest in not speaking *conclusively*; commanders can never retain their authority without speaking *decisively*: *conclusive* when compared to *convincing* is general; the latter is particular; an argument is *convincing*, a chain of reasoning *conclusive*. There may be much that is *convincing*, where there is nothing *conclusive*: a proof may be *convincing* of a particular circumstance; but *conclusive* evidence will bear upon the main question." (*Crabb: Eng. Synon.*)

2. *Biblical Study:* A book of reference in which all the words existing in a particular version of the Bible are arranged alphabetically—part of the verse being extracted with each, so that if one remember a notable word in any part of the Bible he may find, with scarcely any expenditure of time, where it occurs. A similar work may be constructed to enable students to find where each Hebrew word occurs in the Old Testament, or each Greek one in the New Testament or in the Septuagint. The first known Concordance of the Bible in any language was that of St. Anthony of Padua, who was born in 1195, and died in 1231. His work was called *Concordantiæ Morales*, and was of the Latin Vulgate. It formed the basis of a more elaborate concordance, also of the Vulgate, that of Hugo de Santo Caro, better known as Cardinal Hugo. This was published in A.D. 1244. The first Hebrew concordance was that of Rabbi Mordecai Nathan, commenced in 1438 and finished in 1448. The first Greek concordance to the New Testament was that of Xystus Betuleius, whose real name was Birck: it came forth in A.D. 1546. The first English concordance to the New Testament was that of Thomas Gybson, before A.D. 1540: the first to the whole English version of the Bible that of Marbeck, A.D. 1550. These, of course, preceded the appearance in A.D. 1611 of the authorised version of the Bible. The elaborate and well-known work of Cruden appeared first in 1737.

3. *Literature:* In the same sense as 2, except that the work is constructed to facilitate reference to some other book than the Bible. The first known concordance to Shakespeare was that of Ayscough, in 1790. Mrs. Cowden Clarke's elaborate and most useful work first appeared in 1847. cŏn-cor'-dăt, *** cŏn-cor'-dāte**, *s.* [Fr. *concordat;* Low Lat. *concordatum*, from Lat. *concordo* = to be of one mind.] [CONCORDANCE.]

Ecclesiol. & Ch. Hist.: A compact, a convention, or an agreement entered into between the Pope and a sovereign prince or a government for regulating the affairs of the Church within the kingdom. A concordat between Pope Calixtus II. and the Emperor Henry V. of Germany was agreed upon in 1122, which terminated the fierce controversy about investitures, and still to a certain extent regulates the affairs of the Roman Catholic Church in Germany. In 1516 a concordat took place between Pope Leo X. and Francis I., King of France, by which the Chapters were deprived of the right which they had formerly enjoyed of electing the bishops of the several sees. After much delay and royal importunity the French Parliament reluctantly registered this surrender of privilege on March 15, 1518. Omitting less interesting concordats, a celebrated one took place on July 15, 1801, between Pope Pius VII., acting through Cardinal Consalvi, and Napoleon Bonaparte, then first consul. This engagement re-established the Papal authority in France, but not within its former limits; for it placed the clergy, in temporal and even in some spiritual matters, under the jurisdiction of the civil power. Other concordats with the French government were on January 25, 1813, and Nov. 22, 1817. On August 18, 1835, a concordat concluded between Pope Pius IX. and the Emperor Francis Joseph I. of Austria considerably increased the legal power of the Papacy in that empire; but, exciting much dissatisfaction, it was virtually abolished in 1868. There have been concordats with various other Roman Catholic governments.

cŏn'-crēte, *a.* & *s.* [Fr. *concret* (m.), *concrète* (f.); Sp., Port., & Ital. *concreto*, all from Lat. *concretus*.] [CONCRETE, *v.*]

A. *As adjective:*

I. *Ord. Lang.:* Grown together, formed by the union of many particles into one mass.

"The first *concrete* state, or consistent surface, of the chaos, must be of the same figure as the last liquid state."—*Burnet.*

II. *Technically:*

1. *Logic:*

† (1) *Of names:* Standing for a thing—as John, sea, table—as distinguished from standing for an attribute of a thing—as whiteness, old age. This is the sense in which the schoolmen used the logical term *concretus*. (*J. S. Mill: Logic*, bk. i., ch. ii., § 4.)

(2) Special, as opposed to general. John Stuart Mill considers that the practice of using the word concrete in this sense, and abstract in the sense of resulting from abstraction or generalization, has grown up in modern times, being either introduced by Locke or at least having gained currency from his example. Mr. Mill himself avoids it, and employs the word concrete in his Logic only in sense 1 (q.v.). (*J. S. Mill: Logic*, bk. i., ch. ii., § 4.)

2. *Arith., Math., &c.* (*Of numbers and quantities*): Stated to be of certain persons or things as opposed to an abstract number. Thus in the expressions, 6 quires of paper, or 1,000 soldiers, 6 and 1,000 are concrete numbers, but 4, 2, 27, are abstract.

"Thus the *Concrete* process is special, and the Abstract is general. The character of the *Concrete* is experimental, physical, phenomenal, while the Abstract is purely logical, rational. The *Concrete* part of every mathematical question is necessarily founded on consideration of the external world, while the Abstract part consists of a series of logical deductions."—*Martineau: Comte's Positive Philosophy*, bk. i., ch. i., p. 41.

3. *The Physical Sciences* (*Of a Science*): Having as its subject of investigation the description and classification of particular objects as opposed to a science having for its aims the investigation of laws. Thus, zoology and geology are mainly concrete sciences; pure mathematics is an abstract one.

4. *Gram.* (*Of words*): Referring to something special, and hence resolvable into two words. Thus, *to love* is concrete; it can be resolved into (1) the state of being or existing, and (2) into the state of spreading that existence temporarily or permanently as the state of love. But the verb *to be* is solely abstract.

B. *As substantive:*

* 1. *Ord. Lang.:* A mass formed by the union of parts or particles previously separated. [CONCRETION.]

2. *Building:* A composition used for the foundations of large buildings, or for securing stability or freedom from damp. It is composed of lime, coarse gravel and sand in various proportions, mixed up thoroughly with water.

2. The mass thus formed.

"Heat, in general, doth not resolve and attenuate the juices of a human body; for too great heat will produce *concretions*."—*Arbuthnot: On Aliments.*

II. *Geol.:* Either a mechanical aggregation or a chemical union of particles of calcareous or other material producing spherical, oval, or less regularly formed balls in argillaceous or other strata. Such nodules have frequently a shell or other organism constituting the nucleus around which the aggregation or union has taken place. [CONCRETIONARY DEPOSITS.]

† **cŏn-crē'-tion-ăl,** *a.* [Eng. *concretion*; *-al.*] Pertaining to concretions, containing concretions, concretionary. (*Brande.*)

cŏn-crē'-tion-ăr-ў, *a.* [Fr. *concrétionnaire.*] Characterised by, or containing, concretions.

"Among the most remarkable examples of *concretionary* structure . . ."—*Lyell: Manual of Geol.*, ch. iv.

concretionary deposits.

Geol.: Strata are not arranged primarily by their mechanical structure, but by the succession of life which they contain. No epoch, great or small, is therefore called that of concretionary deposits, but these exist more or less, here and there, in all parts of the system. The more notable concretions are those described by Prof. Sedgwick as existing in the magnesian limestone of the north of England, which in some places is so studded with them that it looks like a great pile of cannon balls fitted for ordnance of different calibres, with which are commingled smaller shot, some no larger than a pea. (*Lyell, &c.*)

* **cŏn-crē'-tĭve,** *a.* [Eng. *concret(e)*; *-ive.*] Producing or tending to produce concretions.

* **cŏn-crē'-tĭve-lў,** *adv.* [Eng. *concretive*; *-ly.*]

2. In a concretive manner; so as to form concretions.

* **cŏn-crē'-tūre,** *s.* [Eng. *concret(e)*; *-ure.*] A concretion. (*Johnson.*)

* **cŏn-crew (ew as ū),** *v.i.* [Pref. *con*, and *crew* (q.v.).] To grow or gather together; to unite.

"And his faire lockes, that wont with ointment sweet
To be embaulm'd, and sweat out dainty dew,
He let to grow and grisely to *concrew*."
Spenser: F. Q., IV viii. 40.

* **cŏn-crĭm-ĭn-ā'-tion,** *s.* [Lat. *concriminatio*: *con* = *cum* = with, together; *criminatio* = a charging, accusing.] [CRIMINATION.] A joint accusation. (*Maunder.*)

* **cŏn-cū'-bĭn-ą-çў,** *s.* [Eng. *concubin(e)*; *-acy.*] The same as CONCUBINAGE (q.v.).

cŏn-cū'-bĭn-ąġe, *s.* [Fr., from Lat. *concubinatus*.] [CONCUBINE.]

1. *Ord. Lang.:* The act or state of living with one of the opposite sex without being legally married.

2. *Law & Hist.:* Concubinage was tolerated among the patriarchs (Gen. xxv. 6) and by the Mosaic law (Exod. xxi. 9—12, Deut. xx. 14), and was largely practised by Solomon (1 Kings xi. 3). It was tolerated also among most if not all other Oriental nations, as well as among the Greeks and the Romans to the time of Constantine. The last-named emperor, justly believing that Christianity allowed only marriage and not concubinage (Mark xix. 4, 5; 1 Cor. vii. 1; 1 Tim. iii. 2), rendered the practice illegal. The clergy of the 3rd, 10th, 11th, and other centuries were charged with what is often called concubinage, but in many cases the relations between celibate clergy and monks on the one hand and women living in their houses were not what is generally understood by concubinage. The law of England sanctions only proper marriage: it gives no countenance to concubinage. But on the Continent, morganatic or left-handed marriages sometimes contracted by royal personages are essentially the same as the concubinage of the old Romans. [MORGANATIC.]

* **cŏn-cū'-bĭn-ăl,** *a.* [Lat. *concubinalis.*] Pertaining to or of the nature of concubinage.

Med.: A shaking of the brain produced by a sudden shock or any similar cause, and generally resulting in at least temporary insensibility. In severer cases insensibility may remain for days instead of minutes, coma at first being deep, then less profound, and finally passing away, inflammatory action in some cases supervening on the previous depression. In the worst cases the coma is never removed, but is succeeded by the yet deeper sleep of death. In many cases there is difficulty in distinguishing between concussion of the brain, in which the organ is congested but not permanently injured, and compression of the brain, produced by extravasation of blood upon the surface.

¶ Crabb thus discriminates between *condition* and *station*: "*Condition* has most relation to the circumstances, education, birth, and the like; *station* refers rather to the rank, occupation, or mode of life which one pursues. Riches suddenly acquired are calculated to make a man forget his original *condition*, and to render him negligent of the duties of his *station*. The *condition* of men in reality is often so different from what it appears, that it is extremely difficult to form an estimate of what they are, or what they have been. It is the folly of the present day, that every man is unwilling to keep the *station* which has been assigned to him by Providence: the rage for equality destroys every just distinction in society; the low aspire to be, in appearance, at least, equal with their superiors; and those in elevated *stations* do not hesitate to put themselves on a level with their inferiors." cŏn'-dor, *s.* [Sp., &c., *condor*, from Inca (Peruvian Indian) *cuntur* = the bird defined below.]

Ornith.: A magnificent vulture, *Sarcoramphus* or *Sarcorhamphus gryphus*, which floats with outstretched and motionless wings in airy circles on the higher parts of the Andes, reaching at times the tremendous elevation of 21,000 ft. above the sea-level. The older travellers, as was their wont, exaggerated its size, strength, and ferocity, and it figured as the Western counterpart of the mythical roc described by the Arabs, and by some credited with the ability "to trusse an elephant." Humboldt and Bonpland dissipated these illusions. The former great naturalist met with none the expansion of whose wings exceeded 9 ft. Some of 11 ft. have been said to be met with, and one of 14 ft. Humboldt found that a male condor, the expanse of whose wings was 9 ft., measured 3 ft. 3 in. from the tip of the bill to the extremity of the tail. The male condor has a comb on its head. Both sexes have a ruff round their necks. Their bodies are usually deep black, with a tinge of grey; the wing coverts in the males are white, a [illegible]t at the tips; the legs are bluish grey. [illegible] to say, children are reputed to be in no danger from it, though two condors will attack the vicuña, the heifer, and even the puma. The species is found in most parts of the Andes, especially in Peru and Chili. There is one in the Zoological Gardens in Regent's Park—a sorry bird compared with the mythic condor of pre-scientific times.

cŏn-dŏt-tĭ-ē'-rē (pl. **cŏn-dŏt-tĭ-ē'-rĭ**), *s.* [Ital. = a captain, a carrier, a mercenary leader, from *condotta* = conduct, command, prudence, wisdom, carriage. Cognate with the Lat. and Eng. word *conductor.*]

Hist., &c.: A soldier of fortune, a military leader, who sold his own sword and those of his followers to the highest bidder, regardless of the justice of the cause for which he and they fought.

¶ It was in Italy that the practice began of employing condottieri. In 1225 Genoa engaged 200 of them, led by the Duke of Savoy; and in 1282 Florence hired 500 French, and other States followed the example. The practice received a great impulse about the

beginning of the fourteenth century, when the petty Italian princes and republics began to commute the military services which their subjects had hitherto rendered for money, for both a military void was thus created and means were obtained to fill it by engaging condottieri. In 1342 the cities formed a league to suppress them. But there was occupation for them outside Italy. Large bodies of them took part in the war between Edward III. of England and France, and when the peace of Bretigny, in 1360, terminated their occupation, they fought and plundered on their own account, becoming a terrible scourge to France. They were called free companies, or simply companies or free lances, and numbered about 40,000 fighting men, all heavily armed cavalry. Finally they were transferred to Castile, on their way levying a contribution on the Pope at Avignon. They were an insatiably rapacious race, and so faithless that they were feared by friends as well as foes. They had no scruple about any amount of cruelty, but finding ultimately that it was more advantageous to avoid slaying their foes and simply to capture them unhurt with the view of demanding a heavy ransom, they aimed at making their battles bloodless. Sir John Hawkwood, an Englishman buried at Florence in 1393 with great honour by the citizens, is held to have been one of the last condottieri properly so called.

"Carbon, in general, *conducts* better or worse according to the manner in which it has been prepared."—*De la Rue: Treatise on Electricity*, pt. i., ch. i.; translation.

2. *Music:* To act as conductor of a choir or orchestra in the performance of a musical composition.

"We need not stay to applaud the orchestra for excellent work. Mr. Willing for judicious use of the organ, or Sir Michael Costa for *conducting*, which was a model of clearness, firmness, and tact."—*Daily Telegraph*, Nov. 14, 1881.

3. *Fig.:* To behave, to conduct one's self, to act. (*American.*) (*Webster.*)

¶ Crabb thus discriminates between to *conduct*, to *guide*, and to *lead:* "The first two of these terms convey, according to their real import, an idea of superior intelligence, which is not implied by the latter: on the other hand, this includes an idea of credit and ascendency altogether unknown to the others. We *conduct* or *guide* those who do not know the road; we *lead* those who either cannot or will not go alone. In the literal sense it is the head that *conducts*, the eye that *guides*, and the hand that *leads*. One *conducts* a lawsuit; one *guides* a traveller; one *leads* an infant. In the figurative sense the understanding *conducts;* rule *guides;* the will or influence *leads*. Intelligence ought to *conduct* us in business; politeness ought to *guide* our behaviour in company; taste may *lead* us in the choice of pleasures. We are *conducted* in a certain course, that we may do what is proper to be done; we are *guided* in a certain route, that we may not go astray; we are *led* into society from a sociable temper. A general *conducts* an army according to his knowledge and experience; he is himself *guided* in what he does by fixed rules; he *leads* his army into the field of battle by the word of command. The pilot *conducts* the vessel; the steersman *guides* it: the coachman *guides* his horses on the road: he *leads* them into the stable." (*Crabb: Eng. Synon.*)

He thus discriminates between to *conduct*, to *manage*, and to *direct:* "*Conducting* requires most wisdom and knowledge; *managing* most action; *direction* most authority. A lawyer *conducts* the cause entrusted to him; a steward *manages* the mercantile concerns for his em-

ployer; a superintendent *directs* the movements of all the subordinate agents. *Conducting* is always applied to affairs of the first importance; *management* is a term of familiar use to characterize familiar employment; *direction* makes up in authority what it wants in importance; it falls but little short of the word *conduct*. A *conductor* conceives and plans; a *manager* acts or executes; a *director* commands." (*Crabb: Eng. Synon.*)

cŏn-dŭc'-tą, *s.* [Sp.] A train or convoy of valuable freight. (*Webster.*)

1. *Heat:* The power of conducting or transmitting heat from particle to particle of a body, so as to pass through its mass. [Conductor.]

"*Conductivity* is the quantity of heat that passes in unit time, through unit area of a plate whose thickness is unity, when its opposite faces differ in temperature by one degree."—*Everett: The C. G. S. System of Units* (ed. 1875), ch. ix., p. 42.

2. *Elect.:* The property of acquiring and propagating over the whole extent of its surface the electricity derived from any electrified body with which it may be brought in contact. [Conductor.]

"The *conductivity* of a given wire or conductor is the reciprocal of its resistance."—*Jenkin: Electricity and Magnetism*, ch. xvi., § 4.

¶ (1) *Conductibility* and *conductivity* are sometimes used as synonymous terms, but if etymology be regarded the first of these should be used in a passive sense, and the second in an active one.

(2) With regard to electric currents conductivity and resistance are the opposites of each other.

cŏn-dŭc'-tŏr, *s.* [Lat., Prov., Sp., & Port. *conductor*; Fr. *conducteur.*]

I. *Ordinary Language:*

II. *Technically:*

1. *Railway and coach traffic:* The official who has charge of an omnibus, street-car, or railroad train, whether for passengers or freight.

¶ In England the official in charge of a railway passenger train is known as a guard (q.v.).

2. *Music:*

(1) A director or leader of an orchestra or chorus. It is supposed that a leader or a fugleman was employed by the Assyrians, to regulate the rhythm of the songs or dances; he was armed with two sticks, one of which he beat against the other, and so marked the time or accent. (*Stainer and Barrett.*)

(2) The inventor or leader of a chime or change in bell-ringing. (*Stainer and Barrett.*)

* 3. *Surg.:* (For definition see extract).

"*Conductor*, in surgery, [is] an instrument the use of which is to direct the knife in certain operations. It is more commonly called a director."—*Hooper: Med. Dict.*

4. *Heat:* Anything which is capable of transmitting heat through its mass from particle to particle.

(1) *Bad conductor:* A body which transmits heat slowly and imperfectly. A blanket is a bad conductor of heat: used for a covering at night it prevents the heat generated by the person sleeping from escaping into the external atmosphere; employed to roll up ice it impedes the passage of the warmer external air to the congealed body, and keeps the latter from soon melting. The resins, glass, wood, and especially liquids and gases are other bad conductors of heat.

(2) *Good conductor:* A body which readily transmits heat through it. The metals are high in this respect, the leading ones being arranged in the following order:—(*a*) (highest) platinum, (*b*) silver, (*c*) copper, (*d*) iron, (*e*) zinc, (*f*) tin, (*g*) lead.

5. *Elect.:* A body which acquires and propagates electricity over its whole surface when brought in contact with an electrified body. As in the case of heat, there are *good* and *bad conductors* of electricity. Metals are good conductors, and in the following order:—(*a*) (highest) silver, (*b*) copper, (*c*) gold, (*d*) aluminium, (*e*) sodium, (*f*) zinc, (*g*) cadmium, (*h*) potassium, (*i*) platinum, (*j*) iron, (*k*) tin, (*l*) lead, (*m*) German silver, (*n*) antimony, (*o*) mercury, (*p*) bismuth. Liquids, on the contrary, are bad conductors of electricity.

¶ *Equivalent conductors of electricity:* Conductors which offer an equal resistance to the passage of an electric current, and which might be substituted for each other in any voltaic circuit without altering its intensity. (*Ganot.*)

The Great Conduit in West Cheap, the first leaden cistern in the city, was commenced in 1285, and the Little Conduit in 1442. A conduit at Holborn Cross, commenced in 1498, was repaired in 1577 by Mr. Wm. Lamb, whose achievement is still commemorated in the name Lambsconduit Street, given to a thoroughfare opposite to the Foundling Hospital in Guilford Street. (*Haydn, &c.*)

I. *Ordinary Language:*

1. In the same sense as II. 6.

2. Anything shaped more or less like a mathematical cone.

"Now had Night measur'd with her shadowy *cone* Half way up hill this vast sublunar vault." *Milton: P. L.*, iv. 776.

II. *Technically:*

1. *Geom.:* A solid figure described by the revolution of a right-angled triangle about one of the sides containing the right angle, which side remains fixed. If the fixed side be equal to the other side containing the right angle, the cone is called a *right-angled cone*; if it be less than the other side, an *obtuse-angled*, and, if greater, an *acute-angled cone*. The axis of a cone is the fixed straight line about which the triangle revolves. The base of a cone is the circle described by that side containing the right angle which revolves. Similar cones are those which have their axes and the diameters of their bases proportionals. (*Euclid.*)

2. *Optics:* A pencil of rays of light emanating from a point and diverging as they proceed on their course.

3. *Astron.:* A conical-shaped shadow projected by a planet on the other side from that on which it is illuminated by the sun.

4. *Geol.:* A conical mound or hill produced by the showering down around the orifice of eruption of scoriæ, dust, and the various other materials ejected. Many hundreds of such cones may be seen in France in the ancient provinces of Auvergne, Velay, and Vivarais, arranged in chains of hills. Sometimes such a cone becomes truncated by a portion of the volcano falling in during an eruption. Papandayang, in Java, did so in 1772, and a volcano in Alaska in 1786. (*Lyell.*) There are numerous volcanic cones in America, and it is claimed that some of the largest volcanic mountains, such as Orizaba, in Mexico, have been entirely built up by the deposition of material hurled from a steadily rising crater.

5. *Zoology:*

(1) The English name of any shell of the large tropical molluscous genus Conus (q.v.). The name also of any animal of that genus.

(2) *Pl.* (*cones*)*:* The English name of the Conidæ, a family of Gasteropodous mollusca.

6. *Bot.:* A kind of anthocarpous or collective fruit, called also *Strobilus*, shaped somewhat like a mathematical cone, and consisting of an ament, the carpella of which are (scale-like) spread open, and bear naked seeds. Sometimes these scales are thin with little cohesion, but frequently they are woody and cohere into a single tuberculated mass. A modification of it is the *Galbulus*, which is globular, and has the heads of the carpella much enlarged. The fruit of the Scotch Fir (*Pinus sylvestris*) is a genuine cone, whilst the Juniper is a *galbulus*, with fleshy coherent carpella. It used to be considered as a spike in which the rachis and bracts have become partially lignified, or in which the bracts are membranous. But more recent investigations have shown that it is not a collection of flowers, but an assemblage of seeds, fruit, or pseudo-carp resulting from a single flower. The top furnishes an instance of a true *strobilus* or cone with membranous bracts. (*Alfred W. Bennett, F.L.S., &c.*)

1. An arrangement for varying the speed of the bobbin in spinning-machines, giving them a gradually decreasing velocity as the roving is wound thereon, so as to keep an equal strain on the roving. The lower pulley is driven with a uniform speed, and communicates motion to the other by a band which is slipped towards the larger end of the upper roller as the roving gradually fills the bobbin.

2. *Mach.* A pulley with several faces of varying diameter, so as to obtain varying speeds of the mandrel; a *speed*-pulley. (*Knight.*)

cone-wheel, *s.* A wheel with several applications: (1) Two frustums are in apposition, one having teeth on its face and the other a spirally arranged row of studs. The toothed wheel at its small end acts upon studs on the larger portion of the opposite wheel and conversely. The effect is to confer a regular variability of rotation to the stud-wheel from a regular rotation of the driving-frustum. (2) The frustum, being driven by the motor, communicates motion to the wheel above it. This is not intermittent or variable, but is adjustable. The nearer the upper wheel is to the base of the cone, the faster will it rotate, and conversely. (*Knight.*)

¶ *Confederate States of North America*:

Hist.: The name assumed by the Southern or Slave-holding States which in 1860 and 1861 seceded from the United States of America, maintaining their separation by war, and supporting for a time with great heroism, but not with ultimate success, their attempt at separation. From the first slavery had flourished in the Southern States of the Union, while, speaking broadly, the North had been free from the transcendent evil, and year by year contained an increasing number of abolitionists, eager for its extinction everywhere. Up till 1860 the South had voting power sufficient to elect men of democratic or Southern views to the United States Presidential chair, but in November, 1860, a nominee of the "republican" North, Abraham Lincoln, was legally elected chief ruler. The South feared that he would use his influence against the "domestic institution" which it cherished, and rejected all his protestations that he would strictly conform to the law. On the 20th December South Carolina led the way in secession, followed by Alabama, Florida, Mississippi, Georgia, Louisiana, Texas, part of Virginia, Arkansas, Tennessee, and North Carolina. These took the name of the Confederate States of North America, whilst their opponents called themselves Federals. The secessionists on February 9th, 1861, elected Jefferson Davis their President, the rest tacitly acquiescing in the decision. On April 13th Fort Sumter, near Charleston, was taken by the South Carolinians, and a challenge thus thrown down to the North, which, being accepted, commenced a sanguinary war. On the 21st July the first great battle, that of Bull Run, took place. After the surrender of General Lee to General Grant, on April 9th, 1865, the Confederate cause became hopeless, and peace was soon afterwards restored. The war has resulted in the abolition of slavery throughout the United States.

B. *As substantive*:

1. *Gen.*: One joined or associated with another for mutual aid and support in any enterprise; an ally, an associate.

". . . he found some of his *confederates* in gaol."—*Macaulay: Hist. Eng.*, ch. xxi.

2. *Spec.* (*pl.*): The members of those states of the American Union which supported slavery.

¶ Crabb thus discriminates between *confederate* and *accomplice*: "Both these terms imply a partner in some proceeding, but they differ as to the nature of the proceeding: in the former case it may be lawful or unlawful; in the latter unlawful only. In this latter sense a *confederate* is a partner in a plot or secret association; an *accomplice* is a partner in some active violation of the laws. Guy Fawkes retained his resolution, till the last extremity, not to reveal the names of his *confederates*: it is the common refuge of all robbers and desperate characters to betray their *accomplices* in order to screen themselves from punishment." (*Crabb: Eng. Synon.*)

It vests the supreme legislative and executive authority in a Federal Assembly consisting of two houses—a state council and a national one—the first with 44 members, the latter 135. ". . . he is now ready to discuss the conditions of peace; and with that view he has *conferred with* his colleagues."—*Times*, Nov. 13, 1876.

2. To contribute, to help, to conduce.

¶ Crabb thus discriminates between *to confer* and *to bestow:* "*Conferring* is an act of authority; *bestowing* that of charity or generosity. Princes and men in power *confer*; people in a private station *bestow.* Honours, dignities, privileges, and rank, are the things *conferred*; favours, kindnesses, and pecuniary relief, are the things *bestowed.* Merit, favour, interest, caprice, or intrigue, gives rise to *conferring*; necessity, solicitation, and private affection, lead to *bestowing.* England affords more than one instance in which the highest honours of the state have been *conferred* on persons of distinguished merit, though not of elevated birth: it is the characteristic of Christianity, that it inspires its followers with a desire of *bestowing* their goods on the poor and necessitous. It is not easy to *confer* a favour on the unthankful: the value of a kindness is greatly enhanced by the manner in which it is *bestowed.*" (*Crabb: Eng. Synon.*)

† **cŏn-fĕr-ēe',** *s.* [Eng. *confer*; *-ee.*]

1. One with whom a person confers, discusses, or consults.

2. [CONFEREE.]

cŏn'-fĕr-ençe, *s.* [Fr., from Lat. *conferens*, pr. par. of *confero* = to bring together.] [CONFER.]

I. *Ordinary Language:*

* 1. The act of comparing or collating two or more things together; comparison, collation.

5. A meeting or gathering for the purpose of conferring or comparing views and ideas; or for the settlement and adjustment of differences.

II. *Technically:*

1. *Diplomacy:* A meeting of the representatives of different powers for the purpose of adjusting differences. For details see example.

"It would tend to uniformity of expression in this great debate if you would state that the business of a *Conference* is a Protocol,—that of a Congress, a Treaty. Many hon. members have spoken of a *Conference* who, I am sure, would be surprised to hear that the way of peace is by a Congress."—*Times*, Feb. 2, 1878.

2. *Parliamentary usage:* A meeting of two branches of a legislature, by their committees, to consider and adjust differences respecting bills, &c. (*Webster.*) If a bill is in dispute between the two Houses of the American Congress, the House which at the moment is in possession of the bill asks for the conference. The other House then fixes the time and place. If a "simple conference" fail to adjust matters, a "free conference" follows, and it is customary to ask for one if two of the ordinary kind have failed. Afterwards all, till the difficulty is removed, must be free.

3. *Law:* A meeting between a barrister or other advocate and a solicitor to consult about the case of the client for whom they are acting.

(*a*) *Gen.:* In the foregoing sense.

(*b*) *Spec.:* An annual gathering of the ministers, now with a certain number of lay representatives of the several Wesleyan Methodist congregations, to deliberate upon the affairs of the religious denomination to which they belong. [METHODISM.]

(2) A meeting not held at stated intervals, but arranged to adjust some difference which may exist between Churches or sections of Churches.

¶ Many conferences have taken place abroad between Churches or parties in Churches. Thus there were conferences between Lutherans and Roman Catholics at Ratisbon in A.D. 1601; one in 1685 between John Claude, of the French Reformed Church, and James Bénigne Bossuet, a Roman Catholic; and one at Thorn in 1645, with the view of reconciling the Lutherans and the Reformed Churches; but the conference to which the name is most frequently applied in England was that at Hampton Court.

¶ *Hampton Court Conference:*

Ch. Hist.: A conference between King James I. of England, immediately after his accession to the Southern throne, and the representatives of the Anglican and the Puritan parties in the Church. In October, 1603, the king appointed the conference. Its first meeting was held at Hampton Court on the 14th of January, 1604, James on that day receiving the Anglicans. The second day, January 16th, the Puritans were admitted to make their statement and discuss it with their opponents. The third day, January 18th, the bishops and deans were called in to settle with the king what alterations should be made in the regulations of the Church. Then the Puritans were called in to have the decision intimated to them, and the conference closed.

(1) *The Confession of Augsburg:* [Augsburg Confession].

(2) *The Westminster Confession:* A confession of faith drawn up by what was called an Assembly of Divines, but which had also some laymen among its members, sitting by authority of the Parliament between A.D. 1643 and 1647. Ninety-seven were English and nine, with two "scribes," Scotch commissioners. The place of meeting was Henry VII.'s Chapel at Westminster. The confession of faith was agreed to in 1643, and was designed to be the standard of belief for the whole kingdom, England as well as Scotland. In the former country, however, it was never cordially accepted by the nation; in the latter it was so received. It was ratified by the Scottish General Assembly on August 27, 1647, and by the Parliament of the northern kingdom on February 7, 1649, as it was once more under William and Mary, on June 7, 1690. Its tenets were essentially those of the Reformed Churches in general. It is still the chief symbolic book of the Evangelical Presbyteran Churches in Britain and America, though explanations or qualifications of the teaching on one or two points are permitted in some of the churches.

¶ The Thirty-nine Articles are a confession of faith in all but the name. [Articles.]

5. *Confession of indictment:*

Law: A confession by an accused person that he is guilty of the offence with which he is charged. (*Blackstone.*)

6. *Sacramental Confession:*

Theology & Church History:

(1) *Def.:* "The habitual and detailed confession of sins to a priest, with a view of receiving priestly absolution, and of so becoming better prepared for a faithful and true partaking of the Holy Communion, and of attaining to a higher standard of true spiritual life." (*Bp. of Gloucester & Bristol*, quoted in *Times*, Oct. 27, 1877.)

(2) *Hist.:* Originally notorious offenders were required to confess their sins publicly before the congregation. There existed also an ancient practice of voluntary confession in public of private offences and secret sins. In the fifth century Pope Leo the Great gave permission to confess the latter kind of sins in private to a priest appointed for the purpose. This was the origin of sacramental confession, which soon after became an institution, though confession to a priest was optional till the thirteenth century, when Innocent III., at the fourth Council of Lateran, A.D. 1215, rendered it compulsory. It has since continued to be practised in the Roman Catholic Church, and efforts have been made by the Ritualistic party to reintroduce it into the Church of England. It has no place in the standards of the English Church, and has been repudiated by the vast majority of its adherents, whether clerical or lay. Hooker thus speaks of it: "I dare boldly affirm that for many hundred years after Christ, the Fathers held no such opinion; they did not gather by our Saviour's words (John xx. 23) any such necessity of seeking the priest's absolution by secret and (as they now term it) sacramental confession. Public confession they thought necessary by way of discipline, not private confession as in the nature of a sacrament necessary." (*Hooker: Eccles. Pol.*, vi., c. 436.)

cŏn-fīde′, *v.i.* & *t.* [Lat. *confido: con* = *cum* = with, together, fully, and *fido* = to trust; *fidus* = faithful, trustworthy; Fr. *confier.*]

A. *Intrans.:* To have trust, confidence, or reliance in or upon; to rely, to trust, to believe.

". . . it had been *confided* to two eminent men, . . ."
—*Macaulay: Hist. Eng.*, ch. xi.

¶ Crabb thus discriminates between *to confide* and *to trust:* "Both these verbs express a reliance on the fidelity of another, but *confide* is to *trust* as the species to the genus; we always *trust* when we *confide*, but not *vice versâ*. We *confide* to a person that which is of the greatest importance to ourselves; we *trust* to him whenever we rest on his word for anything. We need rely only on a person's integrity when we *trust* to him, but we rely also on his abilities and mental qualifications when we place *confidence;* it is an extraordinary *trust*, founded on a powerful conviction in a person's favour. *Confidence* frequently supposes something secret as well as personal; *trust* respects only the personal interest. A king *confides* in his ministers and generals for the due execution of his plans, and the administration of the laws; one friend *confides* in another when he discloses to him all his private concerns: a merchant *trusts* to his clerks when he employs them in his business; individuals *trust* each other with portions of their property. A breach of *trust* evinces a want of that common principle which keeps human society together; but a breach of *confidence* betrays a more than ordinary share of baseness and depravity." ¶ Crabb thus discriminates between *confident, dogmatical,* and *positive:* "The first two of these words denote an habitual or permanent state of mind; the latter either a partial or an habitual temper. There is much of *confidence* in *dogmatism* and *positivity,* but it expresses more than either. *Confidence* implies a general reliance on one's abilities in whatever we undertake; *dogmatism* implies a reliance on the truth of our opinions; *positivity* a reliance on the truth of our assertions. A *confident* man is always ready to act, as he is sure of succeeding; a *dogmatical* man is always ready to speak, as he is sure of being heard; a *positive* man is determined to maintain what he has asserted, as he is convinced that he has made no mistake. *Confidence* is opposed to diffidence; *dogmatism* to scepticism; *positivity* to hesitation. A *confident* man mostly fails for want of using the necessary means to ensure success; a *dogmatical* man is mostly in error, because he substitutes his own partial opinions for such as are established; a *positive* man is mostly deceived, because he trusts more to his own senses and memory than he ought. Self-knowledge is the most effectual cure for *self-confidence;* an acquaintance with men and things tends to lessen *dogmatism;* the experience of having been deceived one's self, and the observation that others are perpetually liable to be deceived, ought to check the folly of being *positive* as to any event or circumstance that is past." *(Crabb: Eng. Synon.)*

¶ Crabb thus discriminates between *confinement, captivity,* and *imprisonment:* "*Confinement* is the generic, the other two specific terms. *Confinement* and *imprisonment* both imply the abridgment of one's personal freedom, but the former specifies no cause which the latter does. We may be *confined* in a

room for ill health, or *confined* in any place by way of punishment; but we are never *imprisoned* but in some specific place appointed for the *confinement* of offenders, and always on some supposed offence. . . . *Confinement* is so general a term, as to be applied to animals and even inanimate objects; *imprisonment* and *captivity* are applied in the proper sense to persons only, but they admit of a figurative application. The poor stray brutes, who are found trespassing on unlawful ground, are doomed to a wretched *confinement*, rendered still more hard and intolerable by the want of food: the *confinement* of plants within too narrow a space will stop their growth for want of air." * **B.** *Intrans.:* To affirm, to maintain, to declare.

¶ Crabb thus discriminates between to *confirm* and to *corroborate*: "The idea of strengthening is common to these terms, but under different circumstances: *confirm* is used generally; *corroborate* only in particular instances. What *confirms* serves to *confirm* the mind of others; what *corroborates* strengthens one's self: a testimony may be *confirmed* or *corroborated*; but the thing *confirms*, the person *corroborates*: when the truth of a person's assertions is called in question, it is fortunate for him when circumstances present themselves that *confirm* the truth of what he has said, or if he have respectable friends to *corroborate* his testimony." (*Crabb: Eng. Synon.*)

He also discriminates between *to confirm* and *to establish*: "The idea of strengthening is common to these as to the former terms, but with a different application: *confirm* respects the state of a person's mind, and whatever acts upon the mind; *establish* is employed with regard to whatever is external: a report is *confirmed*; a reputation is *established*: a person is *confirmed* in the persuasion or belief of any truth or circumstance; a thing is *established* in the public estimation. The mind seeks its own means of *confirming* itself; things are *established* either by time or authority: no person should be hasty in giving credit to reports that are not fully *confirmed*, nor in giving support to measures that are not *established* upon the surest grounds; a reciprocity of good offices serves to *confirm* an alliance, or a good understanding between people and nations; interest or reciprocal affection serves to *establish* an intercourse between individuals, which has, perhaps, been casually commenced." (*Crabb: Eng. Synon.*)

cŏn-fĭrm'-ą-ble, *a.* [Eng. *confirm; -able.*] Capable of being confirmed, made certain or assured.

Are to the jealous *confirmations* strong
As proofs of holy writ . . ."
Shakesp.: Othello, iii. 3.

II. *Technically:*

1. *Ecclesiol. & History:*

(1) *Def.:* The act of confirming a child, a young person, or anyone, by the imposition of a Bishop's hands. For further details see (3).

(2) *Hist.:* The passages adduced in support of this rite are Heb. vi. 1, Acts viii. 14—17, xix. 5, 6, especially the first of the three. Confirmation was originally administered as the concluding part of the baptismal ceremony, whether the baptised person were an adult or an infant. Some think the practice was general by the year A.D. 190. The primitive practice in this respect still continues in the Greek Church. Chrism, or sacred ointment, was used at least from the time of Tertullian, in the 2nd century. The unction was the first part of the ceremony; the second was the consignation, or signing with the sign of the cross; and the third was the imposition of the bishop's hands, with the invocation of the Holy Ghost. In the Church of Rome, Confirmation is one of the seven sacraments, the formula used being, "I sign thee with the sign of the cross, and confirm thee with the chrism of salvation, in the name of the Father, and of the Son, and of the Holy Ghost." The opposition by the Protestants in the 16th century to the administration of Confirmation to infants made the Council of Trent postpone it to the seventh year of a child's age.

(3) *Present Practice in the Church of England:* The Liturgy in one place has this heading: "The Order of Confirmation, or laying on of hands upon those that are baptised, and come to years of discretion." When godfathers and godmothers present a child of tender years for baptism, the demand is made by the officiating clergyman, "Dost thou, in the name of this child, renounce the devil and all his works, the vain pomp and glory of the world, with all covetous desires of the same, and the carnal desires of the flesh, so that thou wilt not follow nor be led by them?" To this the reply is made, "I renounce them all." At the conclusion of the Baptismal Service the godfathers and godmothers are exhorted to take care that the child be brought to the bishop to be confirmed as soon as it can say the Creed, the Lord's Prayer, and the Ten Commandments, besides having been instructed in the Church Catechism. When these qualifications have been attained, and a suitable age reached, their names are sent to the bishop, who, if satisfied with them, administers to them publicly, with others, the rite of Confirmation. On their part they are held to confirm and ratify in their own persons the engagements made in their behalf, whilst yet they were infants, by their godfathers and godmothers. After questions put and answered, and prayer offered, the Bishop lays his hand on the head of each one to be confirmed, with prayer, and then with the pronouncing of a blessing. None, it is ordered, are to be admitted to the Holy Communion unless they have either been confirmed or are desirous of being so.

2. *Law:*

(1) *Eccles. Law:* The ratification by an Archbishop of the election of a Bishop by a Dean and Chapter. Originally the Archbishop had real power to decline to confirm such a case, but for about 200 years back he has had no liberty of refusing to do his part; nor have the Dean and Chapter been free to refuse to elect the individual recommended to them in the *Congé d'élire* (*q.v.*).

(2) *Conveyancing:* A kind of conveyance by which a voidable though not a void estate is made "unavoidable" and valid, or a particular estate increased. This can be done by the insertion of the words "ratified and confirmed," with which are generally associated, for further security's sake, the other words "given and granted."

A *conflict* and *combat*, in the proper sense, are always attended with a personal attack; *contest* consists mostly of a striving for some common object. A *conflict* is mostly sanguinary and desperate; it arises from the undisciplined operations of the bad passions, animosity and brutal rage; it seldom ends in anything but destruction: a *combat* is often a matter of art and a trial of skill; it may be obstinate and lasting, though not arising from any personal resentment, and mostly terminates with the triumph of one party and the defeat of the other: a *contest* is interested and personal; it may often give rise to angry and even malignant sentiments, but is not necessarily associated with any bad passion; it ends in the advancement of one to the injury of the other. . . . Violent passions have their *conflicts;* ordinary desires their *combats;* motives their *contests:* it is the poet's part to describe the *conflicts* between pride and passion, rage and despair, in the breast of the disappointed lover; reason will

seldom come off victorious in its *combat* with ambition, avarice, a love of pleasure, or any predominant desire, unless aided by religion: where there is a *contest* between the desire of following one's will and a sense of propriety, the voice of a prudent friend may be heard and heeded." CONFORMABLE AND UNCONFORMABLE STRATA

strata A, B, C, D are conformable with each other, but they rest unconformably on E, F, G, H, I, J, K, &c. The conformability of strata, as a rule, indicates that the record of the leading geological changes between the deposition of the lowest and that of the highest of such conformable strata, speaking broadly, is complete; but a great lapse of time, of which no record has been preserved, at least at this spot, has taken place where unconformability occurs. The former is a book with the pages consecutive; the latter is one with a great

many leaves at one place torn out. A vast lapse of time occurred between the deposition of E and D, during which the lower strata were lifted up to the high angle at which they now stand; there was a much briefer period between the deposition of D and A.

¶ Crabb thus discriminates between *conformable, agreeable,* and *suitable:* "The decisions of a judge must be strictly *conformable* to the letter of the law; he is seldom at liberty to consult his views of equity: the decision of a partisan is always *agreeable* to the temper of his party: the style of a writer should be *suitable* to his subject. *Conformable* is most commonly employed for matters of temporary moment; *agreeable* and *suitable* are mostly said of things which are of constant value: we make things *conformable* by an act of discretion; they are *agreeable* or *suitable* by their own nature; a treaty of peace is made *conformable* to the preliminaries; a legislator must take care to frame laws *agreeably* to the Divine law; it is of no small importance for every man to act *suitably* to the character he has assumed." (*Crabb: Eng. Synon.*)

Cŏn-fū'-cian-ĭsm, *s.* [Eng. *Confucian* (q.v.), and suff. *-ism.*]

Ethics, Comp. Religion, Hist., &c.: The system of belief and practice taught by Confucius. The proper Chinese name of this distinguished man was K'ung-foo-tsze, meaning the master K'ung. According to Mr. Legge, professor of the Chinese language and literature in Oxford University, he was born of very good family, in the year B.C. 551, in Lû, one of the Chinese feudal states, covering a considerable part of what is now the province of Shantung. He married at nineteen; became a teacher in his twenty-second year; grew distinguished about B.C. 517 (*i.e.*, when he was thirty-four), his disciples amounting to thousands; had temporarily to leave Lû in B.C. 516, owing to civil commotion; in B.C. 500, when he was fifty-one, became chief magistrate of the town of Chung-tû, wonderfully reforming the place; was subsequently made superintendent of works, and afterwards minister of crime in the state of Lû, but had to resign these appointments through the jealousy of the neighbouring states; long wandered up and down, teaching and exerting great influence; returned to Lû, but not to his previous offices, in B.C. 483, and died in B.C. 478, aged about seventy-three. Five books are said to have been compiled by Confucius, and four by his disciples; the former are looked upon with the same veneration as the canonical Scriptures among ourselves, the latter also are sacred.

Confucius was highly distinguished as a teacher of ethics. He formulated the golden rule, which is not found in its condensed expression in the old Chinese classics. Tsze-kung having on one occasion asked him if there was one word which would serve as a rule of conduct for all the life, he replied, "Is not reciprocity such a word? What you do not want done to yourself do not do to others." But when Lâo-tsze, who was his contemporary, being born in B.C. 601, enunciated the still more advanced morality of returning good for evil, Confucius, being consulted on the subject by one of his disciples, rejected it, saying, "What then will you return for good? Recompense injury with justice, and return good for good."

Confucius attached very great importance to obedience on the part of children to their parents, and to veneration on the part of people in general to their ancestors. The extension of the same doctrine led to his regarding all society in each kingdom as a great family, in all circumstances owing passive obedience to its sovereign. This tenet of Confucius has rendered his system highly popular with the successive Emperors of China and the Chinese dignitaries generally.

By most persons Confucianism is viewed simply as a system of ethics and of politics. Prof. Legge is of opinion that it is a great error to fail in regarding it also as a religion. Confucius professed to revere the Chinese faith, and to revive or advocate it, instead of setting it aside. That ancient belief was at first monotheistic, but in process of time it had become corrupted by a subordinate worship of multitudinous spirits on the one hand and by superstitious divination on the other. Prof. Legge, therefore, regards the term Confucianism as covering first of all the ancient religion of China and then the views of the great philosopher himself in illustration or modification of its teachings, as when there are comprehended under Christianity the doctrines of the Old Testament as well as the New. He worshipped T'ien, Heaven, but Heaven used by metonomy for God. At the same time there was a more specific word for God, Tî (Lordship or Government), more fully Shang Tî (Supreme Lordship or Government), which he might have employed, but ignored. During the thousand years which preceded the twenty-third century B.C. there had been instituted a worship of God for all the people, the officiator being the king; also a worship of ancestors by all, or at least by heads of families for themselves and their households. Substitution had no place in the religious sacrifices. A part of filial piety was the worship of parents; that of forefathers generally was also enjoined, prayers being offered to the dead. Nothing is stated explicitly about the state of the departed. Future retribution is in this life. As a religion Confucianism is better adapted to the more thoughtful of the Chinese than to the common people, the latter feeling more attached to Booddhism [Booddhism] or Tâoism [Taoism], though commixtures of the several faiths frequently occur. ¶ Crabb thus discriminates between *confusion* and *disorder*: "*Confusion* is to *disorder* as the species to the genus: *confusion* supposes the absence of all order; *disorder* the derangement of order: there is always *disorder* in *confusion*, but not always *confusion* in *disorder*: a routed army, or a tumultuous mob, will be in *confusion* and will create *confusion*; a whisper or an ill-timed motion of an individual constitutes *disorder* in a school, or in an army that is drawn up." (*Crabb: Eng. Synon.*)

***cŏn-fū'-şĭve**, *a.* [Lat. *confus(us)*; Eng. suff. *-ive.*] Confusing, confounding; tending to or causing confusion.

*3. To nullify, to render of none effect or futile.

B. *Intrans.:* To refute in argument.

"He could on either side dispute;
Or, *Confute*, change hands, and still *confute*."

¶ Crabb thus discriminates between *to confute*, *to refute*, *to disprove*, and *to oppugn*: "To *confute* respects what is argumentative; *refute* what is personal; *disprove* whatever is represented or related; *oppugn* what is held or maintained. An argument is *confuted* by proving its fallacy; a charge is *refuted* by proving one's innocence; an assertion is *disproved* by proving that it is false; a doctrine is *oppugned* by a course of reasoning. Paradoxes may be easily *confuted*; calumnies may be easily *refuted*; the marvellous and incredible stories of travellers may be easily *disproved*; heresies and sceptical notions ought to be *oppugned*." congé d'élire, *** congé d'eslire**, *s.* [Fr. *congé d'élire*; Norm. Fr. *congé d'eslire* = leave to elect.]

1. *Law, Ecclesiol., &c.:* Leave given by means of a writ or license to a dean and chapter to elect a bishop when the see to which they belong is vacant. The tendency in Churches has almost always been to claim the liberty to elect their pastors without interference from the civil power; that power, on the contrary, has always, when it could, desired to exercise a determining voice in such elections. During the Middle Ages a protracted struggle on the subject took place between the successive Popes on the one hand, and the civil rulers on the other for the right to nominate bishops. The contest broke out in the eleventh century. In the twelfth, the civil power being temporarily worsted in the contest, the dean and chapter, between A.D. 1125 and 1145, in most places gained the power of electing their bishop. In England the Constitutions of Clarendon in 1164 accorded them this right or privilege,

but retained for the sovereign the liberty of confirming the election, and the right was confirmed by Magna Charta in 1215. By 25 Henry VIII., passed in A.D. 1535, when a vacancy arises in an archbishopric or in a bishopric the king sends the dean and chapter a *congé d'élire*, accompanied by a missive directing them whom to choose. If they delay their choice more than twelve days, or select some one else than the individual named in the missive, they become liable to a *præmunire*.

II. *Nat. Phil., Chem., &c.:* The passage of a body from the liquid to the solid state. Two known laws regulate the phenomenon: 1st, Every body under the same pressure solidifies at a fixed temperature, which is the same as that of fusion. 2nd, From the commencement to the end of the solidification the temperature of a liquid remains constant. Some fats are exceptions to the first rule.

Many liquids, viz., alcohol, ether, &c., have not been seen solidified. Most, however, can be reduced to this state. In ordinary cases liquids becoming solid occupy less space than they did before congelation took place, but water is a notable exception. It expands about 10 per cent. at the moment of passing into ice, hence when frozen in the crevices of rocks it tends to rend them asunder. Frequently a liquid, on becoming solid, crystallises; water occasionally does so. [Snow crystals.] (*Ganot.*)

In the latter the bloodvessels themselves are in an excited state, this excitement drawing to them the blood, with which they soon become engorged. B. *As substantive:*

1. *Geol.:* Pebbles, gravel, or any similar collection of rounded water-worn fragments of rocks, the whole bound together by a silicious, calcareous, or argillaceous cement. It is sometimes called also pudding-stone, from the similarity which it has to a pudding, formed say of raisins or other fruit imbedded in a paste. The pebbles or gravel came originally from some previously-existing rock or rocks: they may have been derived from various sources, each of course having had a history of its own before becoming fixed in the conglomerate. By reading that history the geologist is able to trace the direction of currents of water, &c., and recompose lost chapters, or parts of chapters, in the history of the earth. A conglomerate resembles a breccia, but in a breccia the imbedded fragments are angular, while in a conglomerate they are rounded. Conglomerates occur more or less in all the great formations. There is a notable one subordinate to the Old Red Sandstone, and another—the dolomitic conglomerate of Bristol—in the Lower New Red Sandstone. They exist in all parts of the world and are made up of greatly varied materials, usually of some hard rock such as quartz. Conglomerates are named according to the character of their contained pebbles, as quartz conglomerate, limestone conglomerate, granite conglomerate, &c. They are made up of various sized, round, water-worn stones, cemented together by calcareous ferruginous, or silicious substances, or by simple compression. They are evidently beach deposits, made up of compacted gravel. Most of the rivers between Toulon and Genoa, along the vale of the Maritime Alps, are now forming strata of conglomerate and sand.

¶ *Dolomitic Conglomerate of Bristol:* A conglomerate in which pebbles are cemented together in a red or yellow base of dolomite or magnesian limestone. It is of the Permian age. It is found near Bristol, and in other parts near the Severn. Some of the fragments of the older rocks imbedded in it being angular, there might be temptation to call it a breccia, but more being rounded conglomerate is the more appropriate name. Two amphibian genera—Thecodontosaurus and Palæosaurus—occur in the stratum.

¶ For the difference between a conglomerate and an agglomerate see AGGLOMERATE.

2. *Anatomy:*

cŏn'-gou, * **cŏn'-gō,** *s.* [A corruption of *kong-hú* (Amoy dialect); Chinese *kung-fú* = labourer's tea, or tea on which labour has been bestowed.] A tea classified by the districts from which the several descriptions come. Ningchows, Oonfas, Oopacks, and Kientucks, are called by the London brokers "Blackish-leaf kinds." These are all grown in districts near Hankow. Kysows, Chingwos, and Paklings are called "Reddish-leaf kinds," and are grown in districts near Foochow. A small quantity of Congou called "New make" is grown in the district of Tayshan, near Canton. The flavour of each description is distinctive, arising partly from soil and climate, and partly from mode of curing. Congou is picked as first, second, and third crop, and is prepared by slowly drying the leaf over charcoal fires, and subsequently assorting carefully, so that the leaf is nearly uniform throughout the chop. A chop (an undefined quantity ranging from 200 to 700 chests of about 100lbs. net) is the tea of one or more gardens heaped together, and cured together, having exactly the same appearance and flavour throughout. Two-thirds of the whole import of tea into the United Kingdom consists of Congou.

(1) The Congregation, or the Congregation of Christ, was the designation which the Scottish Reformers assumed during the reign of Queen Mary. The term is supposed to have been taken from the language of the first Scottish National Covenant, that subscribed at Edinburgh on 3rd Dec., 1557, in which the word congregation occurs eight times. (*Hetherington: Hist. Ch. Scotland.*)

"We sall mantein thame, nurische thame, and defend thame, the haill *Congregatioun of Christ*, and everye member thairof, at our haill poweris, and wairing of our lyves.—Unto the quhilk holy Word, and *Congregatioun*, we do joyn us; and also dois renunce and forsaik the Congregatioun of Sathan, with all the superstitiounis, abominationis, and idolatrie thairof."—*Knox: Hist.*, p. 101.

(2) The term is sometimes used in a more restricted sense, denoting one part of the body of Protestants, as distinguished from another, according to local situation. (*Jamieson.*)

"At Perthe the last day of Mail, the yeir of God 1559, the *Congregatioun* of the West Country, with the *Congregatioun* of Fyfe, Perthe, Dundie, Angus, Mernis and Montruis, being conveinit in the toun of Perthe,—ar confedderat—to concurre and assist togither, &c."—*Knox: Hist.*, p. 138.

congregational music.

Music: Music in which the people or congregation take part, as opposed to that which is sung by the trained choir alone. The plain-song of the Responses, Creeds, and of the Lord's Prayer, and the melody of psalm and hymn tunes are congregational music; but services and anthems are specially set aside for performance by the choir, acting as it were as the skilled representatives of the listening and meditating people. (*Stainer & Barrett.*)

¶ *The Congregational Union of England and Wales:*

Ecclesiol. & Ch. Hist.: A union was formed in 1831 among the Congregational Churches for mutual sympathy, counsel, and co-operation. In 1833 a declaration of faith, order, and discipline was published. By its constitution and laws, adopted in October 1871, "The Union recognizes the right of every individual Church to administer its affairs free from external control, and shall not in any case assume legislative authority, or become a court of appeal." It consists of Representative Members, Honorary Members, and Associates. It holds two meetings every year—one, called the Annual Assembly, in London, in May; and the other, called the Autumnal Assembly, in autumn, in some other city or town of England or Wales.

Cŏn-grĕ-gā-tion-ăl-ĭsm, *s.* [Eng. *congregational; -ism.*] The tenets of the Congregationalists (q.v.). Viewing these under the two heads of doctrine and Church government, the former does not essentially differ from that of the other Protestant denominations or from that of the Evangelical party in the Church of England. It is not in doctrine but in government that their peculiarity consists. They believe that every congregation has independent powers of self-government, uncontrolled by any Bishop, or Presbytery, or other external ecclesiastical authority. They recognize a ministry, have deacons as subordinate rulers in the congregation, but allow the congregation itself to decide who are fit to join its ranks, and to act with judicial power in cases of discipline.

Cŏn-grĕ-gā'-tion-ăl-ĭst, *a.* & *s.* [Eng. *congregational; -ist.*]

A. *As adj.:* Pertaining in any way to Congregationalism, or to the adherents of that form of Church government.

B. *As substantive:*

Ecclesiol. & Ch. Hist. (*pl.*):

(1) *Def., &c.:* The adherents of the form of Church government called Congregationalism or Independency, or the members of the religious denomination in which these views have been carried out. They are often termed Independents, the latter name referring to the fact that their several Churches are independent of each other, and in spiritual matters of the civil power; and the term Congregationalists makes it prominent that separate congregations have self-government to an extent which they do not possess in some other religious bodies.

(2) *Ch. Hist.:* Congregationalists in general believe their form of Church government to be of Divine authority, and to have been that of the Apostolic Churches. The adherents of Episcopacy and of Presbyterianism, &c., on the contrary, reject this view, and put in similar claims for their own systems.

Among the sects which from the 13th century separated from the dominant Church, some doubtless had no closer bond than that of fraternal sympathy between different congregations. To descend to more modern times, the tenets of Robert Brown [BROWNISM] were essentially those of modern Congregationalism. He was born about the middle of the 16th century, and was a near relative of the Lord Treasurer Cecil. He was first a preacher, then a schoolmaster, and afterwards a lecturer. From about 1585 he inveighed with fiery vehemence against the corruption, and to a certain extent against the constitution, of the Established Church, his philippics being varied by thirty-two successive imprisonments, some of them in cells where he could not see his hand at noonday. Notwithstanding all efforts to intimidate him, he succeeded about 1593 in setting up a congregation in London. Those in favor of his doctrines were then estimated at 20,000 in number. After a time many of them, with Mr. Brown himself, were obliged to remove to Holland, where several Churches were set up. There they were free to act according to their convictions, but falling into divisions among themselves, they so disgusted their leader that he returned to England, conformed to the Established Church which he had so vehemently and persistently denounced, and became rector of a church in Northamptonshire; was negligent in the discharge of his duty, if not even dissolute in life, and died in 1630, in prison, where he had been confined, not for the sake of conscience, but for striking a constable.

Among the Churches in Holland one was founded at Leyden, by Jacobs and Brown, in 1616. Mr. John Robinson soon after became minister of the Church. He modified the Brownist tenets, rendering them less extreme, and is by many regarded as the real founder of Independency. In his "*Apologia pro Exulibus Anglis, qui Brownistæ vulgo appellantur,*" published at Leyden in 1619, the Latin word *independenter* (= independently) occurs, which may have been the origin of the word Independents as applied to men of his faith. It did not, however, come into use till between 1640 and 1642. It occurs in the title of a work, "Apologetical Narrative of the Independents," published in 1644. In 1616 Henry Jacobs returned to England from Holland and founded a meeting-house. It was the first unequivocal Independent or Congregational church in England. In 1620 a part of Mr. Robinson's congregation at Leyden removed to Plymouth, in New England. They were followed by others of the same denomination, as well as by persecuted Puritans generally all through the 17th century. There the foundations of the Independency or Congregationalism of the New World were laid deep and broad.

In Mr. Robinson's modification of the Brownist doctrines a single ruling officer, or elder, replaced the body of elders which had been devised by Barrowe as a governing body, restoring to the congregation that control of its own affairs which Barrowe's device had partly taken away. As thus constituted the Mayflower community practically governed itself under the judicious counsel of its elder. The Salem colonists, who came over nine years later, were not Independents, but the method of church government in vogue at Plymouth seemed to them so suitable to their requirements, far removed, as they were, from their English brethren, that they adopted it, and formed themselves into an Independent Church, which they made Congregational by taking the right hand of fellowship from Governor Bradford and his fellow delegates from Plymouth. The colonists who followed quickly fell into line with their predecessors, and Congregationalism became the ruling church method in New England, though with a certain element of aristocracy which was not eliminated until after the Revolution, when the Church became purely and fully democratic in doctrine and government.

American Congregationalists to-day recognize the right, and hold it to be the duty, of believers who are so situated that they can conveniently worship and work together, to organize themselves by mutual covenant as a church. This organization becomes Congregational through its public admission to their fraternity by the neighboring Congregational churches. Each such church has a pastor and deacons as officers and a working committee, chosen by the congregation for the purpose of laying out and making efficient the work of the church. There is communion of the churches, and there may be advice and admonition, under extraordinary circumstances, and ecclesiastical councils may be held for such purposes, the welcoming of any new church or pastor to fellowship being done by the council. The council does not exist among English Congregationalists. The Congregational churches of the United States have been united, since 1871, into a National Council, which meets every third year. It is made up of delegates from the churches and communicants of the whole land. Congregationalism spread slowly in the United States, it having scarcely extended beyond the boundaries of New England by 1800, the members who moved to new localities generally becoming Presbyterians. Since the Civil War there has been a marked change in these particulars, and Congregationalism has spread with much rapidity, its churches now existing in every part of the land. It possesses a considerable number of missionary and other associations and theological seminaries, and is in a condition of encouraging growth.

II. *History, Political Geography, &c.:*

1. In the same sense as I. 1 (q.v.).

2. The legislature of the United States, consisting of a Senate and House of Representatives. Whilst yet the British settlers in North America were colonists only, occasions arose when it was needful for them to co-operate for the attainment of particular ends. They did so in 1745 for the capture of the French fortified port of Louisbourg in Cape Breton, and in 1754 for holding a conference with the Indian tribes north of New York. The War of Independence made the union of the scattered colonies closer and more permanent, and the governing body then established developed into the present Congress. The American Congress must assemble at least once a year, the day of meeting being the first Monday of December. The Senate consists of two members from each state. They are chosen by the legislature of each state for six years, one third of them elected biennially. The Vice-President is *ex officio* President of the Senate. The numbers of the House of Representatives are apportioned to the several states according to population; they are elected for two years. All money bills must originate in this House, which corresponds to the House of Commons in England

¶ Among modern congresses may be mentioned that of Münster, A.D. 1643—1648, which put an end to the Thirty Years' war; that of Ryswick, in 1697, at which peace was signed between England, France, Holland, Germany, and Spain; that of Utrecht, in 1713, signed between the Ministers of England, France, and Spain, the Emperor Charles VI., however, holding out. Coming to more modern times, a congress of sovereigns, or their representatives, was held at Vienna to arrange about the resettlement of Europe after the great disturbance of ancient landmarks produced by the wars of the first Napoleon. A congress was held at Berlin between June 13 and July 13, 1878, the British representatives being Lords Beaconsfield and Salisbury, to submit to the judgment and decision of Europe the results of the Russo-Turkish war. At this congress our country obtained the permission to hold under the Porte the island of Cyprus, to be used as a place of arms whence Turkey might be defended if war again broke out.

cŏn'-hў-drĭne, *s.* [Lat. *con(ium)*; Eng. *hydr(ate)*; and suff. *-ine* (*Chem.*) (q.v.).]

Chem.: $C_8H_{17}NO$. An alkaloid, which is contained in the flowers and ripe seeds of hemlock, *Conium maculatum.* It is obtained along with conine and ammonia, by exhausting the flowers or the seeds with hot water, acidulated with sulphuric acid, supersaturating with hydrate of potassium, and distilling. The distillate is neutralised with sulphuric acid, and evaporated on a water-bath, then absolute alcohol is added, which precipitates ammonia sulphate. The solution is then evaporated to remove the alcohol, then supersaturated with concentrated potash, and shaken with ether. The brownish-red ethereal solution is separated and evaporated on a water-bath, heated to 100°, and distilled in a stream of hydrogen in an oil-bath. The conine is purified by neutralising with hydrochloric acid and recrystallizing from alcohol. Conhydrine remains in the retort, and on heating sublimes in the upper part and neck of the retort. It is purified by crystallization from ether. Conhydrine crystallizes in pearly iridescent laminæ, which melt at 120°, and boil at 225°. By the action of phosphoric anhydride, P_2O_5, it is converted into conine. It is a narcotic, but less powerful than conine. Conhydrine sulphate crystallizes in flat prisms, readily soluble in water.

conic nodes, *s. pl.*

conic sections, *s. pl.*

Geometry, Algebra, & History:

1. *Geom.:* That part of geometry which treats of the parabola, the ellipse, and the hyperbola, produced by sections of a right cone, made in three different ways. If a right cone be cut by a plane parallel to a plane which touches the cone along the slant side, the resultant figure will be a parabola; if the section be made through both slant sides, it will be an ellipse; and if one side be cut through by a plane which, produced backwards, cuts the other side likewise produced the section constitutes a hyperbola. Two other geometric figures can be produced when a cone is cut by a plane. If the plane cut

from the apex down vertically to the base, a triangle is produced, whilst if it do so parallel to the base a circle is the resultant; but conventionally a triangle and a circle are excluded from the list of "conic sections," the term being limited to the three figures first mentioned.

2. *Alg.:* Algebraically viewed, conic sections are curves of the second degree—*i.e.*, the curves belonging to such equations between co-ordinates are of the second degree.

3. *Hist. of Geom.:* The Greeks studied conic sections about the time of Plato, B.C. 390. About B.C. 330 Aristæus wrote a treatise on them, and Apollonius eight books on the subject about B.C. 240. But in the hands of the Greek geometricians no special interest was known to attach to conic sections. Their value was not perceived till Galileo discovered that projectiles move in parabolic curves, and Kepler that planets do so in elliptical orbits. Now conic sections are regarded as an indispensable part of the higher geometry, with continual application to natural philosophy.

conical projection, *s.*

Geom.: A method of projecting a part of a sphere upon a plane. A cone is formed which touches a sphere in a small circle, and the several points of the sphere are then projected upon the cone by lines drawn through the centre. This being done, the parts adjacent to the small circle of contact will be found projected into figures very like the originals. In Flamsteed's projection the degrees of latitude are made equal, which is very nearly accurate; and the parallels of latitude are perpendicular to the vertical right line into which the middle longitude circle is thrown. The proportions in length between the meridians of longitude and the parallels of latitude are made everywhere the same as on the actual globe. This plan, slightly modified, was adopted by the French.

cō′-nĭ-fĕr, *s.* [Lat. *conus* = a cone, and *fero* = to bear.]

Botany:

1. *Sing.:* A tree or shrub of the order Coniferæ (q.v.).

2. *Pl.* (*Conifers*): The English name given by Lindley to his order Pinaceæ, generally called Coniferæ (q.v.).

cō-nĭf′-ĕr-æ, *s. pl.* [CONIFER.]

1. *Bot.:* An order of plants, one of those recognised in 1751, in the infancy of botany, by Linnæus. Jussieu in 1789 adopted the name. Lindley altered it to Pinaceæ, but retained the term Conifers as its English equivalent. Formerly he called them Conaceæ. They belong to the class or sub-class of Gymnosperms. They are fine trees or shrubs abounding in resin. Leaves linear, acerose, or lanceolate, entire at the margin, often fascicled. Inflorescence amentaceous, each floret with one stamen or a few united; ovary spread open: it arises from the axil of a membranous bract; ovule naked in pairs or several inverted. Fruit, a cone [CONE]; embryo with two or many cotyledons. Lindley divides it into two suborders, (1) Abieteæ, with the ovules inverted and the pollen oval, curved; and (2) Cupressæ, with the ovules erect and the pollen spheroidal. Sometimes the Taxineæ (Yews) figure as a third, but Lindley makes them a distinct order, and calls them Taxaceæ (Taxads). Nearly 200 species are known. They are most useful to man, supplying timber, with oil, resin, and turpentine. They are diffused over the world. Their appropriate habitat is in temperate climates; when in the tropics it is generally high on the mountainsides.

2. *Palæont.:* The wood of the Coniferæ may be distinguished from those of ordinary dicotyledons by the absence of proper ducts in the woody layers, and by the presence of large areolar discs on the walls of the wood cells. The wood of the Yew (*Taxus baccata*), and the Douglas Fir (*Abies Douglasii*), are exceptions to this rule. On the other hand, the Winteræ, which are not coniferous, but belong to the Magnoliads, have similar circular disks. When by the chemistry of nature wood is silicified, these areolar discs are at least as visible under the microscope as in recent coniferous wood; and when they occur in fossil stems, or fragments of stems, these are presumably the remains of Coniferæ. The ducts or glands also aid in distinguishing genera. When in double rows they are placed side by side in the European pines and firs, but are arranged alternately in the Araucarias. The Coniferæ commence at least as early as the Devonian. They are well represented in the Carboniferous rocks, being associated there with the higher Acrogens. They flourish through the Secondary period, and on to present times. The Carboniferous Conifers may have been taxoid (Yew-like), though the genus Pinites also occurs. The species in the Secondary rocks were more akin to the Araucaria of our gardens than to ordinary pines.

cō-nĭf′-ĕr-ĭn, *s.* [Eng., &c., *conifer; -in.*]

Chem.: A glucoside occurring in the cambium of coniferous woods (*Abies excelsa, Pinus Strobus, Larix europœa*, &c.). It forms needle-shaped crystals, $C_{16}H_{22}O_8{\cdot}2H_2O$, which effloresce in dry air, give off water at 100°, and melt at 185°: soluble in hot water, and slightly soluble in alcohol. With strong sulphuric acid coniferin gives a violet colour, turning red; on diluting the sulphuric acid solution a blue resin is deposited. Coniferin boiled with dilute acids is converted into a resin and glucose.

cō-nĭf-ĕr-ŏl, *s.* [Eng., &c., *conifer;* Lat. *ol(eum).*]

Chem.: Coniferyl alcohol, $C_{10}H_{12}O_3$, or $C_6H_3\begin{cases}OCH_3\\OH\\C_3H_4{\cdot}OH.\end{cases}$ A substance isomeric with ethyl vanillin, is formed along with glucose by the action of emulsion and water on coniferin. Coniferol forms white prismatic crystals, melting at 74°, soluble in ether, and forming a red solution with sulphuric acid. If dissolved by alkalies and reprecipitated by acids, it is thrown down as an amorphous white powder, which turns brown. Crystallised coniferol exposed to the air smells like vanilla; by oxidation and agitation with ether it yields vanillin.

cō-nĭf′-ĕr-oŭs, *a.* [Lat. & Eng. *conifer*, and Eng. suff. *-ous.*]

Bot.: Cone-bearing. Used specially of trees and shrubs belonging to the order Coniferæ, though what are technically "cones" are not confined to this order; and the berries of some genera, Junipers for instance, formed internally on the model of a cone, look to the uninitiated quite different.

"*Coniferous* wood exhibits a peculiar structure which cannot be mistaken, and which is formed in no other set of plants."—*Carruthers: Gymnospermatous Fruits, from Sec. Rocks of Britain.*

cō-nĭf′-ĕr-ȳl, *s.* [CONIFEROL.]

* **conig,** *s.* [CONY, CONYNG.]

"Have we nowther *conig* ne cat, that thai ne er etin."—*Minot*, p. 37.

cō′-nī-ine, *s.* [CONINE.]

cō′-nĭm-ą, *s.* [The native name.] A resin used for making pastilles. Also called Incense Resin, or Gum Hyawa; it is obtained from the Incense-tree, *Icica heptaphylla.* It contains an essential oil and a resin.

cō′-nĭ-mēne, *s* [Mod. Lat. *conim(a)*, and suff. *-ene.*]

Chem.: C_5H_8. The essential oil, obtained by distilling incense resin with a large quantity of water. By fractional distillation, and purifi-

cation with metallic sodium, an oil was obtained which boiled at 264°. Conimene is a colourless mobile liquid, nearly insoluble in water, mixing with alcohol, ether, and benzene; it has a pleasant aromatic odour, and burns with a smoky flame.

cō'-nīne, *s.* [Lat. *conium* = hemlock, and Eng. suff. *-ine* (*Chem.*).]

1. *Chem.:* $C_8H_{18}N$. Also called Coniine, Cicutine, Conia. An alkaloid contained along with Conhydrine (q.v.) in hemlock, *Conium maculatum*. Conine is a limpid, oily liquid, boiling at about 168°. It has a penetrating, repulsive suffocating odour, something like that of mice, and is a violent poison. It is slightly soluble in water, giving an alkaline reaction; it is very soluble in alcohol and ether. It is inflammable, burning with a bright smoky flame; on exposure to the air it turns brown, and finally into a resinous mass. Oxidised with chromic acid, it yields normal butyric acid; treated with excess of acid, conine is decomposed into a resin and a salt of ammonia. Conine forms a crystalline mass of needles when acted on by bromine vapour. Conine is a secondary monamine, $NH·(C_8H_{14})''$. Nitrous anhydride passed into pure Conine, and water then added, yields azoic hydrine. Hydrochloric acid gas colours dry conine red and then blue, but if moist forms crystals. A modification of conine has been prepared synthetically; by heating butyric aldehyde with alcoholic ammonia, and distilling the dibutyraldine $C_8H_{17}NO$ which is formed, a volatile oil is obtained which has the odour and physiological properties of conine. It differs in giving a greenish-blue colour with hydrochloric acid; it precipitates silver oxide more slowly, and has no action on polarised light.

2. *Pharm.:* The action of conine is to paralyse the voluntary muscles and to act on terminations of the motor nerves, producing paralysis of the respiratory muscles and death by asphyxia. The leaves of *Conium maculatum* are used to prepare extract of Hemlock (*Extractum Conii*), which is used to form pills, and as an inhalation. Preparations of Conium are used to allay muscular spasm in chorea, &c., also to alleviate cancer; the inhalation to relieve cough in bronchitis, pertussis, and phthisis.

1. *Bot.:* A genus of Umbelliferous plants, family Smyrnidæ. The fruit, which is broadly

CONIUM

1. Single Flower. 2. Petal. 3. Fruit. 4. Transverse section of Fruit.

ovate, has five prominent waved or crenate ribs, without vittæ; the calyx teeth are obsolete, the petals obcordate; the general involucre of few leaves, the partial one with three, all on one side. *Conium maculatum* is the Common Hemlock, the term *maculatum* referring to the spots or purple blotches on the stem. There is a fusiform biennial root. The leaves are tripinnate, the leaflets pinnatifid, with acute and often cut segments. When bruised, the leaves smell very unpleasantly. The flowers are greenish-white. They appear in June and July. The plant is two to four, five, or more feet high. It is common in waste places, by roadsides, and under walls in Britain. It occurs also in Eastern Asia. It is a good anodyne and a valuable medicine in scirrhus, scrofulous tumours, dropsy, and epilepsy. Taken in undue quantities it produces giddiness, dimness of sight, nausea, and paralysis of the limbs. It is not, however, nearly so poisonous as the Water Hemlock, *Cicuta virosa*. It seems to have been the Cicuta and not the Conium which was used to poison Socrates. [Hemlock.] Still the conium is highly dangerous. The extract which renders it so is called Conia (q.v.).

(2) *Conii Fructus:* The dried ripe fruit of *Conium maculatum*. Preparation: *Tinctura Conii.*

In the focus of one they placed a wire basket, containing a red-hot ball, while in the focus of the other was a piece of gun-cotton or phosphorus. The effect was to ignite the inflammable body; whereas if placed above or below the focus it did not take fire. This demonstrated the existence of foci in connexion with mirrors, whilst exhibiting also the laws of reflection. (*Ganot.*)

(4) *Conjugate points, lines, &c.:*

Geom.: Two points, lines, &c., are said to be conjugate when their relative positions might be interchanged without any alteration in the language used in describing that property or those properties of theirs to which reference is being made. To this a writer in the *Penny Cyclopædia* points out that there is an apparent exception—viz., the conjugate point of a curve, by which is meant a single point lying by itself, the co-ordinates of which satisfy the equations of the curve without its actually being on the continuous branch of that curve. To abolish this anomaly of language he proposes to call the latter case the conjunct instead of the conjugate point of a curve, or to term it an evanescent oval.

(3) A number or class of verbs conjugated alike.

¶ There are in English two conjugations, an old or strong one, and a new or weak one, according to the method of forming the past tense. In the former it is expressed by vowel-change only, as *shake, shook;* in the latter by the addition to the verbal root of the syllable *d* or its euphonic substitute *t*, as *love, loved.* Weak verbs sometimes have a change of vowel, as *buy, bough-t, teach, taugh-t*, though they generally form the past tense and past participle by the addition of *-ed*, or (when the infinitive ends in *e*) *-(e)d.*

2. *Biol. & Phys.:* A process occurring among some of the lower plants and animals, in which the substance of two distinct organisms comes into contact, and becomes fused into a single mass or "zygoite." Always in plants, and sometimes in animals, it is connected with reproduction. Among the former it has been met with in the following algal groups: Zygnemaceæ, Desmidiaceæ, Diatomaceæ, and Palmellaceæ; and among the Fungi, in genera which contain some of the plants giving rise to mildew. In the animal kingdom conjugation is produced by the more or less complete fusion of two, three, four, or more individuals. Example: *Podophyra pyrum*, an infusorian. The process is called also zygosis (q.v.). (*Griffith & Henfrey.*)

II. *Technically:*

1. *Astron.* (*Of three heavenly bodies*): The state of being in apparent union with each other. One distinction is between *equatorial* and *ecliptic conjunction.* Two heavenly bodies are said to be in *equatorial* conjunction, or, more briefly, in conjunction with respect to a third, when they have the same right ascension measured on the equator of the third. Similarly, they are in *ecliptic* conjunction with respect to it when they have the same longitude measured on the ecliptic of the third. Both conjunctions take place during the eclipse of the sun, though at different moments, unless the eclipse be exactly central. Another division is into a *superior* and an *inferior* conjunction. In the case of one of the inferior planets (Mercury and Venus) its conjunctions with the sun are the points of nearest approach to it, the *inferior* conjunction occurring when the planet passes between the earth and the sun, and the former when it does so behind the great luminary. The conjunction of a superior planet occurs when it is in the same line as the earth, on the same side of the sun. Planets may also have conjunctions with each other. As Professor Airy points out, the periodic times of Jupiter and Saturn being to each other in the proportion of 2 to 5, and their axes being moreover different, conjunctions between them will successively take place at different parts of their orbits. For about 450 years one planet makes the other move more quickly than its normal rate, and then for 450 more slowly than it, things reverting to what they were at the beginning after 900 years. The extreme perturbation will be 1° behind at one time, and 1° before at another, that is, 2° in all. *Apparent* conjunction supposes the spectator on the surface of the earth, *true* conjunction imagines him to be looking from its centre.

". . . the duration of the month, as marked by the revolution of the moon round the earth, and its return to *conjunction* with the sun, . . ."—*Lewis: Astron. of the Ancients* (ed. 1862), ch. i., § 5, p. 22.

2. *Gram.:* A part of speech joining together sentences, parts of sentences, and single words; as, "Judah was his sanctuary, *and* Israel his dominion" (Ps. cxiv. 2); "The sea saw it, *and* fled" (ver. 3); "Still waters, *but* deep." The conjunction does not, like the preposition, alter the case of the noun or pronoun following it; as, He *and* I. There are two classes of conjunctions, *coordinating* and *subordinating* conjunctions, the former joining coordinate clauses and the latter uniting subordinating or dependent clauses to the principal clause of a sentence. (*Bain: Higher Eng. Gram.*)

¶ Crabb thus discriminates between *conjuncture* and *crisis:* "Both these terms are employed to express a period of time marked by the state of affairs. A *conjuncture* is a joining or combination of corresponding circumstances tending towards the same end: a *crisis* is the high-wrought state of any affair which immediately precedes a change: a *conjuncture* may be favourable, a *crisis* alarming. An able statesman seizes the *conjuncture* which promises to suit his purpose, for the introduction of a favourite measure: the abilities, firmness, and perseverance of Alfred the Great, at one important *crisis* of his reign, saved England from destruction." (*Crabb: Eng. Synon.*)

II. *Law:* Blackstone makes witchcraft, conjuration, enchantment, and sorcery synonymous terms. See the ¶ for the distinction drawn between them by Cowel.

¶ According to Cowel, the difference between *conjuration, witchcraft, sorcery,* and *enchantment* was supposed to be, that a person using the first endeavoured by prayers and invocations to compel the devil to say or do what he commanded him, whilst the practice of *witchcraft* dealt with the Evil One or with a familiar spirit in a conciliatory manner, offering blood or other gifts; the one, in short, tried to coerce the foul fiend, while the other coaxed him. In *sorcery* again there was a personal conference with the demon, whilst in *enchantment* there was no more than the use of such charms as medicines, or certain words, no apparition taking place or being expected. For the penalties formerly inflicted upon offenders for these imaginary crimes see specially WITCHCRAFT.

Things the most dissimilar may be *connected* or *combined*; things of the same kind only can be *united*. Things or persons are *connected* more or less remotely by some common property or circumstance that serves as a tie; they are *combined* by a species of juncture; they are *united* by a coalition: houses are *connected* by means of a common passage; the armies of two nations are *combined*; two armies of the same nation are *united*. A *connexion* may be either close or remote: a relation direct or indirect. Logic (Of terms): Denoting a subject and implying an attribute. (*John S. Mill.*)

¶ By a subject, in the foregoing definition, is to be understood anything which possesses attributes. White, long, and virtuous are connotative. Thus white has for its subject things, and implies that they have the attribute whiteness. But John is not connotative: it refers to a subject only, without mention of attributes. Nor is whiteness connotative: it relates to an attribute only. It is opposed to connotative, and sometimes but improperly called abstract. A non-connotative term is one which signifies a subject only or an attribute only. John and whiteness (already mentioned) are non-connotative. Connotative names have also been called DENOMINATIVE (q.v.). (*J. S. Mill: Logic* (2nd ed.), bk. i., ch. ii., § 5.)

Scott: Marmion, vi. 5.

* **2.** To attain, to succeed.

¶ Crabb thus discriminates between to *conquer*, to *vanquish*, to *subdue*, to *overcome*, and to *surmount:* "Persons or things are *conquered* or *subdued;* persons only are *vanquished*. An enemy or a country is *conquered;* a foe is *vanquished;* people are *subdued* . . . one may be *vanquished* in a single battle; one is *subdued* only by the most violent and persevering measures. William the First *conquered* England by *vanquishing* his rival Harold; after which he completely *subdued* the English. *Vanquish* is used only in the proper sense; *conquer* and *subdue* are likewise employed figuratively, in which sense they are analogous to *overcome* and *surmount*. That is *conquered* and *subdued* which is in the mind; that is *overcome* and *surmounted* which is either internal or external. We *conquer* and *overcome* what makes no great resistance; we *subdue* and *surmount* what is violent and strong in its opposition; dislikes, attachments, and feelings in general, either for or against, are *conquered;* unruly and tumultuous passions are to be *subdued;* a man *conquers* himself; he *subdues* his spirit." 3. One who overcomes or subdues; a victor, a vanquisher.

"Increasing commerce and reviving art
Renew the quarrel on the *conqueror's* part."
Cowper: On Heroism.

¶ The epithet is especially applied to William of Normandy, who conquered England in 1066. According to some William is improperly called the Conqueror; for, though victorious in battle, he had to come under an engagement to observe the laws of the realm before obtaining the crown. But this is not uncommon with conquerors. Speaking of what we usually call, though somewhat improperly, the right of conquest, Blackstone says that it is "a right allowed by the law of nations, if not by that of nature; but which in reason and civil polity can mean nothing more than that, in order to put an end to hostilities, a compact is either expressly or tacitly made between the conqueror and the conquered that, if they will acknowledge the victor for their master, he will treat them for the future as subjects and not as enemies." (*Blackstone: Comment.*, introd., § 4.)

¶ Crabb thus discriminates between *conqueror* and *victor:* "A *conqueror* is always supposed to add something to his possessions; a *victor* gains nothing but the superiority: there is no *conquest* where there is not something gotten; there is no *victory* where there is no contest: all *conquerors* are not *victors*, nor all *victors conquerors:* those who take possession of other men's lands by force of arms make a *conquest;* those who excel in any trial of skill are the *victors*." (*Crabb: Eng. Synon.*)

* **cŏn'-quer-ŏŭs (quer** as **kĕr),** *a.* [Eng. *conquer; -ous.*] Conquering, victorious.

II. *Technically:*

1. *Hist.:* The term "the Conquest" is applied to a revolution in British history following on the defeat of Harold II. by William, Duke of Normandy, in 1066, which reduced the Saxons for a century and more to the position of a subject and oppressed race, land, power, everything having been transferred to the Normans. [Conqueror.]

2. *Feudal & Scots Law:* (See extract).

"What we call purchase, *perquisitio*, the feudists called *conquest*, *conquaestus*, or *conquisitio*: both denoting any means of acquiring an estate out of the common course of inheritance. And this is still the proper phrase in the law of Scotland: as it was among the Norman jurists, who styled the first purchaser (that is he who brought the estate into the family who at present owns it) the *conquestor* or *conquaestor*. Which seems to be all that was meant by the appellation which was given to William the Norman."—*Blackstone: Commentaries*, bk. ii., ch. xv.

* **con-quest-or,** * **con-quest-our,** *s.* [Eng. *conquest; -or.*] A conqueror, a victor.

* **cŏn sā'-crĕd,** *a.* [Consacre, *v.*] Consecrated, dedicated.

"There was a Peach-tree growing there amid
God-Camosh Temple, to him *consecred*."
Sylvester: Du Bartas; Maiden's Blush, 672.

* **con-sail,** *v.t.* [Counsel, *v.*]

* **cŏn-săn-guĭn'-ĕ-al,** *a.* [Lat. *consanguinalis* = of the same blood.] The same as Consanguineous (q.v.).

cŏn-săn-guĭn'-ĕ-ŏŭs, *a.* [Lat. *consanguineus*, from *con* = *cum* = with, together, and *sanguineus* = full of blood, bloody; *sanguis* (genit. *sanguinis*) = blood.] Of the same blood; related by birth; descended from a common ancestor; near of kin.

"Am not I *consanguineous?* am I not of her blood?"
—*Shakesp.: Twelfth Night*, ii. 3.

cŏn-săn-guĭn'-ĭ-tў, *s.* [Lat. *consanguinitas*, from *con* = *cum* = with, together, and *sanguis* = blood.] The quality or state of being related by blood; nearness of kin; descent from a common ancestor.

". . . connected by *consanguinity* or affinity with several others, . . ."—*Macaulay: Hist. Eng.*, ch. xviii.

¶ Consanguinity is of two kinds, lineal and collateral. Lineal subsists among persons who descend in what may be called a straight line from a common ancestor: thus grandfather, father, son, grandson, great grandson have lineal consanguinity. Collateral consanguinity is when there is descent from a common ancestor, but not in a direct line: as grandfather, father, his brother, son of the first, &c., &c. Here the line is not direct. If A. has two sons, each of whom has children, these children are related to each other by consanguinity. *Consanguinity*, which is of Latin origin, is nearly the same as *kindred*, which is Anglo-Saxon.

cŏn-sar'-çĭn-āte, *v.t.* [Lat. *consarcinatus*, pa. par. of *consarcino*, to patch together.] To patch, to botch.

* **cŏn-sar-çĭn-ā'-tion,** *s.* [Eng. *consarcin(ate); -ation.*] The act of piecing or patching together; patchwork.

* **con-schaft,** * **con-schaift,** *s.* [Jamieson suggests Flem. *kundschap.*] Knowledge, intimation, information.

cŏn-sĭençe (sc as **sh),** * **con-cience,** * **con-sciens,** * **con-scyence,** * **kun-scence,** *s.* [Fr. *conscience;* Lat. *conscientia* = (1) a joint knowledge, a being privy to, a witnessing; or, by metonomy, the persons who are privy to anything; (2) consciousness, knowledge, feeling; (3) the moral sense, conscience, from *consciens*, pr. par. of *conscio* = to be conscious (of wrong); *conscius* = one cognisant of: *con* = together, and *scio* = to know, to understand, to perceive.]

I. *Ordinary Language:*

1. *Of mental states or operations:*

(1) Consciousness, knowledge of our personal existence and of the mental state existing within us or the outward action being performed by us at the time.

"Her virtue, and the *conscience* of her worth,
That would be wooed, and not unsought be won."
Milton: P. L., bk. viii.

(2) Inmost thought or feeling, real sentiments. [¶ (1).]

"Dost thou in *conscience* think,—tell me, Æmilia,—
That there be women do abuse their husbands
In such gross kind?" *Shakesp.: Othello*, iv. 3.

(3) Reason, sense, common-sense, understanding.

"Why dost thou weep? Canst thou the *conscience* lack,
To think I shall lack friends?"
Shakesp.: Timon, ii. 2.

2. *Of moral feeling:*

(1) The moral sense. As the etymology indicates, it signifies "knowledge along with"—but whether with a thing, or a person or Being, it is difficult to determine. South makes it with a thing. He says, in his sermons: "Conscience, according to the very notation of it, importing a double or joint knowledge; to wit, one of a divine law or rule, and the other of a man's own action; and so is properly the application of a general law to a particular instance of practice." (*South.*) It may, however, be along with God. Paul uses it in this sense in Rom. ix. i. [II. 1.]

"... a *conscience* which indeed too often failed to restrain him from doing wrong, but which never failed to punish him."—*Macaulay: Hist. Eng.*, ch. xx.

(2) The decision or the impulse of conscience, morality.

* (3) A point of conscience, in sense 2 (1).

"We must make a *conscience* in keeping the just laws of superiours."—*Taylor: Holy Living.*

¶ (1) *A bad conscience:* A reproving conscience, a conscience which at the moment is reproaching one for a fault or crime.

(2) *A good conscience:* An approving conscience, a conscience which at the moment is producing delight in the heart on account of some good deed recently done.

(3) *A seared conscience:* A conscience which by being habitually disregarded has now lost its sensitiveness, as flesh, when its nerves have been destroyed by being cauterised, ceases to feel. The phrase is founded on 1 Tim. iv. 2, "... having their conscience seared with a hot iron."

(4) *A tender conscience:* A conscience which is very sensitive to moral considerations. It is the exact opposite of a seared conscience.

"A preliminary question, which perplexed *tender consciences*, was submitted to the Bishops."—*Macaulay: Hist. Eng.*, ch. xvii.

(5) *In all conscience:* In all reason, in truth, really, truly.

"... many of his travelling experiences were sufficiently exciting *in all conscience*."—*Times*, Jan. 20, 1877.

(6) *In conscience:* Nearly the same as *in all conscience*, but not quite so strong an expression.

"What you require cannot, *in conscience*, be deferred beyond this time."—*Milton.*

(7) *Out of all conscience:* Unconscionable, unreasonable.

II. *Technically:*

1. *Mental Phil. & Ethics:* The moral sense, the internal monitor which signifies approval when we do well, and inflicts more or less acute and lasting pain when we act sinfully. It is generally held to be the Vicegerent of God, or, as Byron calls it, the Oracle of God, letting us know what the Divine judgment on our conduct is; but here the difficulty arises, that the indications of the conscience are often wrong. Saul was conscientious when he took part in the cruel martyrdom of Stephen and subsequently persecuted the Christians, but, in popular phrase, his conscience was not enlightened. This suggests that conscience is not a simple but a complex part of our nature. In its decisions there mingles first an operation of fallible intellect judging of conduct, then follows an emotional part generating the satisfaction or the dissatisfaction produced by that judgment. In this case the emotional part would be the Vicegerent of God, and unerring, such mistakes of reasoning as might be committed being those of the intellect. Moral sensibility may be blunted by neglect of the monitions of conscience, till at length it scarcely operates, the state being reached in which, to use Scripture phraseology, "the conscience is seared as with a hot iron." [I. 2 (1)(3).]

2. *Mech.:* A plate resting against the drill-head and enabling the pressure of the breast or hand to be brought upon the drill; a pallette. (*Knight.*)

¶ *Courts of Conscience:*

Law: Courts of request established by the London Common Council to be used for the recovery of small debts. They arose at least as early as A.D. 1517; they were superseded by County Courts, established in 1846 by 9 and 10 Vict. c. 95.

conscience clause, *s.*

Law & Education: A clause designed to protect the conscience of a child or of the parents from being subjected to religious teaching of which the latter disapprove. It was first introduced into the Endowed Schools Act of 1860, which had to do with secondary education. With regard to primary or elementary education, the State, in aiding denominational schools by money either raised by rates or taken from the imperial exchequer, both the one and the other obtained from persons belonging to all the denominations in the country or no denomination at all, considered that when there was one school in a parish for the education of both Church and Dissenting children, the latter should be exempted from any religious teaching to which their parents objected, as well as from attendance at the Established church. In November, 1863, accordingly the Committee of Council on Education extended the conscience clause, borrowed from the endowed, to elementary schools of the kind described in this article. Many of the clergy were much opposed to it, but it held its place and was introduced as an essential provision into the great Education Act of 1870.

conscience-money, *s.* Money forwarded, as a rule anonymously, to the Chancellor of the Exchequer for unpaid income-tax. In most cases the sender intentionally underestimated his income when filling in his return on the subject, but subsequently repented. It amounts to some thousand pounds a year.

2. *Objectively:* Inspired by conscience.

"For faithful we must call them, bearing
That soul of *conscientious* daring."
Wordsworth: The White Doe of Rylstone, canto ii.

¶ Crabb thus discriminates between *conscientious* and *scrupulous*: "*Conscientious* is to *scrupulous* as a whole to a part. A *conscientious* man is so altogether; a *scrupulous* man may have only particular *scruples:* the one is therefore always taken in a good sense; and the other at least in an indifferent, if not a bad sense. A *conscientious* man does nothing to offend his *conscience;* but a *scrupulous* man has often his *scruples* on trifling or minor points: the Pharisees were *scrupulous* without being *conscientious:* we must therefore strive to be *conscientious* without being over *scrupulous.*" (*Crabb: Eng. Synon.*)

cŏn-scien'-tious-lў (scien as shĭ-ĕn, and **tious as shus),** *adv.* [Eng. *conscientious; -ly.*] In a conscientious manner, under, or as if under, the operation of conscience.

2. *Mil.* : A compulsory enlisting or levying of soldiers.

"In 1798 General Jourdan presented to the Council of Five Hundred a project of a law for a new mode of recruiting, under the name of *conscription.*"—*National Cyclopædia of Useful Knowledge.*

¶ The word *conscription* was first used in connection with recruiting in France, though the same system was in force among the old Romans. In France it was enacted as a law on September 5, 1798, and, according to Alison, more than 4,000,000 Frenchmen were thus taken from their proper employments between 1792 and 1813. In the American war of secession, 1861—1865, there was a conscription carried out, though the armies of the North were very largely recruited by voluntary enlistment. It is the common method of recruiting armies in Europe, except in Great Britain, where a different military system prevails, and where it is not deemed necessary to make soldiers of the whole male population.

cŏn'-sĕ-crāte, *v.t.* [From Lat. *consecratus*, pa. par. of *consecro* = to make holy, to dedicate as sacred to a deity : *con* (intens.), and *sacro* = to set apart as sacred ; *sacer* (m.), *sacra* (f.), *sacrum* (neut.) = sacred.]

I. *Ordinary Language* :

1. *Of setting apart* :

(1) To set apart as sacred, to devote to the true God or to some false deity. (Used of persons [II. 1], of money, of times, of anything.)

"And Micah *consecrated* the Levite ; and the young man became his priest, . . ."—*Judges* xvii. 12.

"He shall *consecrate* unto the Lord the days of his separation, . . ."—*Num.* vi. 12.

(2) To devote to a sacred or high purpose.

". . . the Sabbath, and other days *consecrated* to religious duty, . . ."—*Scott : The Chase.*

2. *Of rendering holy* :

* (1) *Of a person* : To canonize.

(2) *Of a thing* : To hallow, to make interesting in a high degree through the associations connected with it.

"A kiss can *consecrate* the ground,
Where mated hearts are mutual bound."
Campbell : Hallowed Ground.

II. *Technically* :

* **1.** *Roman Antiq.* : To deify. (Used of an emperor.)

2. *Ecclesiology* :

* (1) *Of a saint* : To canonize.

(2) *Of a bishop* : With solemn ceremonies to set him apart to the sacred office which he is to fill.

cŏn-sĕ-crā-tion, * con-se-cra-ci-oun, * con-se-cra-cyon, *s.* [Fr. *consécration* ; Prov. *consecracion* ; Sp. *consagracion* ; Ital. *consecrazione*, all from Lat. *consecratio* = (1) religious dedication, (2) deification, especially of the Roman emperors, (3) a magical incantation.] [CONSECRATE, *v.*]

I. *Ordinary Language* :

1. The act of consecrating ; the state of being consecrated.

"And thou shalt take the breast of the ram of Aaron's *consecration*, and wave it for a wave offering before the Lord . . ."—*Exod.* xxix. 26.

* **2.** Things consecrated.

". . . of *consecrations*, as I commanded, saying, Aaron and his sons shall eat it."—*Lev.* viii. 31.

II. *Technically* :

1. *Ethnic Customs* : Consecration of animals, priests, temples, &c., to the several divinities worshipped was and is common among the ethnic or pagan nations in all parts of the world.

2. *Roman Antiq.* : When the Roman emperors had the word *consecratio* applied to them, it meant that they were deified and held to be entitled from that time forward to receive divine honours.

3. *Jewish Antiq.* : At the exodus from Egypt the firstborn males in Israel, whether of man or beast, were sanctified to God—*i.e.*, consecrated or devoted to Him—the beasts to be sacrificed, the children to be redeemed (Exod. xiii. 2, 12, 15). In lieu of these firstborn sons the Levites became specially God's (Num. iii. 12, 13, 45 ; viii. 13—18). Aaron and his sons were anointed and consecrated to the priestly office (Num. iii. 3). For details of the ceremonies observed see Lev. viii. The tabernacle was "anointed" and "sanctified" (Num. vii. 1) ; the first temple and its furniture dedicated (1 Kings vii. 51, viii.), as was the second (Ezra vi. 16) ; so also was the wall of Jerusalem (Neh. xii. 27), and all these were consecrations under other names.

4. *Christian Ecclesiol. & Church Hist.* : Consecration may be resolved into two elements : (1) the dedication of persons or things to the service of God with appropriate ceremonies, (2) the formal declaration that in consequence of belonging to God they are now sacred ; for, as South well remarks, "we must know that consecration makes not a place sacred, but only solemnly declares it so ; the gift of the owner to God makes it God's, and consequently sacred." The term is used—

(1) *Of persons* :

(*a*) *Spec.* : Of the consecrating of bishops, priests, and deacons. In the Liturgy one of the headings is, "The form and manner of making, ordaining and consecrating of Bishops, Priests and Deacons ;" and the thirty-sixth of the Thirty-nine Articles is entitled, "Of consecrating of Ministers."

(*b*) (*In the Church of Rome*) : The canonization of a saint.

(2) *Of things* : It is used specially of the consecrating of churches. It was not till Christianity had existed for some little time that separate buildings were erected for Divine worship, ordinary rooms at first being used for the meetings of the faithful (Acts i. 13). When separate churches were built, some simple rite of consecration was almost sure to follow at once ; the ceremonies gradually became more numerous and striking, till, when Constantine established Christianity, they became splendid and imposing. They are still so in the Church of Rome, and to a less extent in the Church of England. The elements in the Holy Communion are also consecrated.

5. *Law* : When in England a church is consecrated by a bishop none but the worship of the Established Church can be permitted within its walls or precincts. Till lately, when a burial-ground was consecrated, none but the clergyman of the parish or his delegate could officiate within it ; but the Burials Act of 1880 in certain cases removed the restriction. [BURIAL, A. II. 2.]

¶ There is a distinction between *consecration, ordination*, and *dedication*. The first is applied to persons or things, the second to persons only, the last to things. The term "consecration" is used of kings and bishops, the term ordination of ordinary clergymen or ministers ; while dedication is used of temples, altars, &c.

cŏn'-sĕ-crā-tŏr, *s.* [Lat.] One who consecrates any person or dedicates any temple, altar, money, &c.

¶ Crabb thus distinguishes between *to consent*, *to allow*, and *to permit :* "The idea of determining the conduct of others by some authorized act of one's own is common to these terms, but under various circumstances. They express either the act of an equal or a superior. As the act of an equal we *consent* to that in which we have an interest ; we *permit* or *allow* what is for the accommodation of others : we *allow* by abstaining to oppose ; we *permit* by a direct expression of our will ; contracts are formed by the *consent* of the parties who are interested. The proprietor of an estate *permits* his friends to sport on his grounds ; he *allows* of a passage through his premises. It is sometimes prudent to *consent* ; complaisant to *permit* ; good natured or weak to *allow*. When applied to superiors, *consent* is an act of private authority ; *permit* and *allow* are acts of private or public authority : in the first case, *consent* respects matters of serious importance ; *permit* and *allow* regard those of an indifferent nature : a parent *consents* to the establishment of his children ; he *permits* them to read certain books ; he *allows* them to converse with him familiarly." ¶ Crabb thus discriminates between *consequence* and *result :* "*Consequences* flow of themselves from the nature of things ; *results* are drawn. *Consequences* proceed from actions in general ; results proceed from particular efforts and attempts. *Consequences* are good or bad ; *results* are successful or unsuccessful. We endeavour to avert *consequences* which threaten to be bad ; we endeavour to produce *results* that are according to our wishes. Not to foresee the *consequences* which are foreseen by others, evinces a more than ordinary share of indiscretion and infatuation. To calculate on a favourable *result* from an ill-judged and ill-executed enterprise, only proves a consistent blindness in the projector." (*Crabb : Eng. Synon.*)

(2) *Spec.:* One belonging to the party described under 2, or holding similar convictions in any other state.

2. *Pl.* (*Conservatives*): One of the two great political parties in England and the British empire. In every society which has ever existed one large section of the community has been led by mental constitution, by its position in society, or by other causes, to deprecate change, unless where the necessity for it can be proved by irrefragable evidence. Others, from the same causes, tend to become a party of movement, and on much less proof of its necessity than that which the first would deem sufficient, advocate change and what they deem reform. Though both parties are needful to the healthy political life of the country, yet each is disposed to regard the other as its mortal foe. Each has a central organization, besides an immense number of local societies scattered over the country. The prominent spirits of each party are never long at rest, but seek every opportunity of advocating their views. Perhaps one-eighth of the community have pronounced political views, and are able to explain why they hold them; the remainder constitute an inert mass of no strong political convictions, but this swaying first to one side and then to the other, successively puts each party in power. The national obligations entered into by the one are scrupulously respected by the other, even though it may at first have opposed their being formed. Both these parties consented for many years to be known only by nicknames, which caricatured their failings—the party which, speaking broadly, resisted change being stigmatized by the nickname Tory, and that which advocated it by Whig. Neither term was of English origin: the term Tory [TORY] came originally from Ireland, and Whig [WHIG] from Scotland. It was inevitable that sooner or later these names should be exchanged for others of a more complimentary character, and accordingly the "Tories" called themselves "Conservatives," and the "Whigs" assumed the title of "Liberals." For the first employment of the term, see *Conservative Party.* It was suggested that their opponents were the Destructive party, but the name was unjust and was soon forgotten. Lord Beaconsfield attempted to revert to the old name Tory, but his followers did not take kindly to it, and the word was left to his opponents to use. Constitutionalist was also proposed as a substitute for it, but the use of that new term did not long continue.

The first French revolution being in the earlier stages everywhere welcomed with enthusiasm by the party of progress, the reign of terror so discredited that party that it placed power in the hands of the Conservatives for about forty years. The strong Liberal movement which produced the first Reform Bill terminated its rule for the time. Since then it has been in office for the following periods: Under Sir Robert Peel, from December 26, 1834, to April 18, 1835, and again from September 6, 1841, to July 6, 1846; under the Earl of Derby from February 27, 1852, to December 28 of the same year; from February 25, 1858, to June 18, 1859; and again from July 6, 1866, to February 27, 1868; under Benjamin Disraeli, afterwards Lord Beaconsfield, from February 27, 1868, to December 27 of the same year; and from February 21, 1874, to April 28, 1880; under the Marquis of Salisbury, from June 24, 1885, to February 6, 1886, and from August 3, 1886, to August 16, 1892, when Mr. Gladstone took office. What is *consigned* is either given absolutely away from one's self, or only conditionally for one's own purpose : what is *committed* or *entrusted* is given conditionally. A person *consigns* his property over to another by a deed in law ; a merchant *consigns* his goods to another, to dispose of them for his advantage ; he *commits* the management of his business to his clerks, and *entrusts* them with the care of his property. *Consign* expresses a more positive measure than *commit*, and *commit* than *entrust*. When a child is *consigned* to the care of another, it is an unconditional surrender of one's trust into the hands of another ; but any person may be *committed* to the care of another with various limitations ; and when he is *entrusted* to his care, it is both a partial and temporary matter, referring mostly to his personal safety, and that only for a limited time." cŏn′-sor-tĭsm, *s.* [Eng. *consort*; *-ism.*]

Biol.: Physiological partnership, or vital association, between organisms of different kinds; symbiosis. It is loosely employed in the sense of mutualism or commensalism (q.v.), and more strictly to denote such intimate relationship as exists according to some authorities in the fungoid and algoid elements in Lichens, or between the unicellular algæ formerly known as "yellow cells," and the majority of the Radiolarians. It has been said that the colour of the fresh-water Sponge and of the green Hydra is due to the presence of symbiotic algæ; but this view is strongly combated by Prof. E. Ray Lankester, who asserts that it is really due to chlorophyll bodies, which have been found also in higher organisms, as in some Worms. Some green Protozoa, *e.g.*, *Stentor polymorphus*, *Coleps viridis*, and *Ophrydium viride*, have also colourless forms, and this has given rise to doubt whether the colour in the green forms is due to chlorophyll bodies or to the presence of symbiotic green algæ.

cŏn'-sta-ble, * con-es-ta-ble, *s.* [Dan. *constabel*; Sw. *konstapel*; Dut. *konnetabel*; Fr. *connétable*; O. Fr. & Prov. *conestable*; Sp. *condestable*; Port. *condestavel*; Ital. *conestabile*; Low Lat. *conestabulus*, from Lat. *comes stabuli* = (lit.) count of the stable.] [I. 1, (1).]

I. *Formerly:*

1. *On the Continent:*

(1) *In the Roman empire during the latter part of its existence:* The *comes stabuli*, the functionary from which the mediæval constable developed, had (as his name imported) charge of the stables with the horses housed therein. He was not a plebeian groom, but a high functionary, who might now be called Master of the Horse. The English word *constable* has not, as far as we know, been applied to him in this rudimentary stage of his development.

(2) *In France and some other continental countries during mediæval times:* Under the early French kings the *comes stabuli*, now transformed into the "*conestable*," was a high functionary of government. He was commander-in-chief of the army, which then depended for success a good deal upon horsemen; was judge of military offences, and regulated all matters of chivalry. Such was the position of the first celebrated, and then notorious military leader, known to the French as the Conestable, and in English history as the Constable, de Bourbon, who fell in his daring attack on the city of Rome on May 5, 1527. In 1627, the office, which his possession of it had rendered immortal in history, was abolished. Napoleon I. revived it, but it was finally brought to an end on the restoration of the Bourbon dynasty.

". . . had, since the eleventh century, given to France a long and splendid succession of Constables and Marshals."—*Macaulay: Hist. Eng.*, ch. xix.

2. *In England:* The office of the constable crossed the Channel with the Norman conquerors, the dignitary who filled it being called Lord High Constable. The functions were the same as those of his French brother. As chief judge of the Court of Chivalry he encroached on the jurisdiction of other legal functionaries, and his power in this direction had to be abridged, which it was by the statute 13 Richard II., c. 2. The office of the High Constable, though carrying with it what may be called the Commander-in-chiefship of the army, was hereditary, being attached to certain manors. It was therefore held successively by the Bohuns, Earls of Hereford and Essex, with their heirs, the Staffords, and the Dukes of Buckingham. In 1514, Henry VIII. discharged the manors of the burden of furnishing hereditary commanders to the army as an indirect means of dismissing the commanders themselves. When, in 1522, the then existing Duke of Buckingham was attainted for high treason, the manors themselves were confiscated to the Crown.

II. *Now:* The constable of English common law was early introduced in the American colonies, and now exists throughout the United States, though the office has lost many of its former functions in the cities, where it is in great part replaced by the police. In boroughs, townships, &c., the constable still constitutes the executive officer of the law, he having the power in some states, to pursue and arrest any criminal or breaker of the public peace, while everywhere it is his function to execute the orders of the magistrate. In England, constables are of two kinds, high and petty constables. The function of the latter is to preserve the peace.

"This attempt to revive the license of the Attic Stage was soon brought to a close by the appearance of a strong body of *constables* who carried off the actors to prison."—*Macaulay: Hist. Eng.*, ch. xx.

¶ *Special constables* are respectable citizens sworn in to aid the regular police force to keep order on occasions of special danger. [CHARTIST.]

III. A large glass, the contents of which one is obliged to drink, if in company he did not *drink fair*; that is, did not drink as much as the rest of the company. (*Scotch.*)

¶ *To outrun the constable, to overrun the constable:* To spend more than one can afford; to live beyond one's means.

¶ Crabb thus discriminates between *constancy*, *stability*, *firmness*, and *steadiness*: "*Constancy* respects the affections; *stability* the opinions; *steadiness* the action or the motives of action; *firmness* the purpose or

resolution. *Constancy* prevents from changing, and furnishes the mind with resources against weariness or disgust of the same object; it preserves and supports an attachment under every change of circumstances: *stability* prevents from varying, it bears up the mind against the movements of levity or curiosity, which a diversity of objects might produce: *steadiness* prevents from deviating; it enables the mind to bear up against the influence of humour, which temperament or outward circumstances might produce; it fixes on one course and keeps to it: *firmness* prevents from yielding; it gives the mind strength against all the attacks to which it may be exposed; it makes a resistance, and comes off triumphant." (*Crabb: Eng. Synon.*)

cŏn'-stant, *a.* & *s.* [Fr. *constant;* Ital. *constante;* from Lat. *constans*, pr. par. of *consto* = to stand firm: *con* = *cum* = with, together, and *sto* = to stand.]

(4) *Indeterminate constant:* [*Arbitrary constant*].

(5) *Variation of constants:*

Math.: This strange expression, which seems a contradiction in terms, means that what is theoretically a constant, and would be so if no other force operated, is made variable by the action of such a force. If, for instance, the orbit of a planet were a constant, a perturbation of its course in that orbit might and would be effected by a planet being in its vicinity as it passed a certain point; the constant would then for a time become a variant.

Hevelius, of Dantzic, a distinguished astronomer, who flourished in the seventeenth century, intercalated nine others; and finally Lacaille, who prosecuted astronomical researches in the southern hemisphere, from 1751 to 1755, under the auspices of the French Government, found it needful to add twenty-seven more, mostly in regions of the sky which the ancients never beheld. II. *Med.:* An undue retention of the fæces or their imperfect evacuation. When the morbid affection is but slight it is of little moment. In many cases constipation is from a torpid condition of the liver, or loss of tone in the muscular coat of the alimentary canal, which in some cases is moreover distended by flatus. In many cases it is produced by the eating of an undue quantity of food, or of food that is indigestible. It is continually present in those who lead a sedentary life. Purgatives may temporarily remove a confined state of the bowels, but without abundant exercise in the open air no permanent cure can be expected.

¶ Crabb thus discriminates between *to constitute, to appoint*, and *to depute:* "The act of choosing some person or persons for an office, is comprehended under all these terms: *constitute* is a more solemn act than *appoint*, and this than *depute:* to *constitute* is the act of a body; to *appoint* and *depute*, either of a body or an individual: a community *constitutes* any one their leader; a monarch *appoints* his ministers; an assembly *deputes* some of its members. To *constitute* implies the act of making as well as choosing; the office as well as the person is new; in *appointing*, the person but not the office is new. A person may be *constituted* arbiter or judge as circumstances may require; a successor is *appointed*, but not *constituted*. Whoever is *constituted* is invested with supreme authority derived from the highest sources of human power, common consent; whoever is *appointed* derives his authority from the authority of others, and has, consequently, but limited power; no individual can *appoint* another with authority equal to his own; whoever is *deputed* has private and not public authority: his office is partial, often confined to the particular transaction of an individual, or a body of individuals." II. *Technically:*

1. *Political Economy, Government, &c.* In this sense the word Constitution is popularly used with great vagueness. In the United States it indicates a written body of laws adopted by a convention, and constituting a fundamental instrument to which all legislation must conform. The United States as a whole, and each State as a unit, have constitutions of this character, which can be changed only in the manner of their adoption, and amended only under certain stringent regulations. The Constitution of the British Kingdom, on the contrary, is unwritten, and is in a state of constant change, it being essentially formed by the body of parliamentary law, and the rules and methods of governmental procedure which have grown up through centuries, and the fundamental postulates of which are as stable as those of the Constitution of the United States.

In this country such an instrument was made necessary by the weakness of the bond between the states formed by the Articles of Confederation, an instrument originated during the Revolutionary struggle, and which in a few years after its close proved so ill suited to hold the separate units of the country together, that it became evident that either a stronger tie of union must be made or the States would fall asunder. These "Articles of Confederation and Perpetual Union" may be looked upon as the first Constitution of the United States. The Convention which formed the existing Constitution met on May 14, 1787, and was made up of the wisest and ablest of the statesmen which the country then possessed, and some of whom have never been surpassed for political wisdom and sagacity. It continued in session until the autumn of that year, and produced an instrument which has ever since been the admiration of legislators, and which Mr. Gladstone describes as the most wonderful work ever struck off at a given time by the brain and purpose of man, yet which was, in many of its leading provisions, the result of a compromise between conflicting opinions, and when first promulgated satisfied no state and few persons. The instrument has strengthened with its age, and has served the nation admirably through more than a century of its existence, with the aid of a few amendments adopted to meet new conditions, or to supply omissions in the original instrument. Of the government formed by it the Supreme Court, which constitutes the Judiciary Department, is the greatest innovation. This great court stands alone in the governmental devices of nations, and has proved of the highest utility as a controlling power over the legislative department, which it prevents from setting aside in any sense the principles of the Constitution.

The several States have closely followed the general government in adopting a written constitution for each, with the same device of adjustment in a series of State Supreme Courts. These state constitutions have been modified and replaced from time to time, as the old instruments proved imperfect, the great State of New York, for instance, having within the last few years perfected the formation of a new constitution.

Other meanings have been given to the word Constitution. In the uprisings of the people of Continental Europe in 1848 constitutions were demanded, the instrument sought being a solemn compact between the people and their despotic rulers, which would have the effect to take from the Sovereign some of the power which he had usurped, and return it to its original source, the hands of the people.

"If this [the freedom and independency of parliament] be shaken, our *constitution* totters. If it be quite removed,—our *constitution* falls into ruin. That noble fabric, the pride of Britain, the envy of her neighbours, raised by the labour of so many centuries, repaired at the expense of so many millions, and cemented by such a profusion of blood; that noble fabric, I say, which was able to resist the united efforts of so many races of giants, may be demolished by a race of pigmies."—*Bolingbroke: Dissertation upon Parties.*

2. *Ecclesiology:*

Apostolic Constitutions: Ordinances for the discipline of the Church, particularly the apostolical constitutions and a collection of regulations attributed to the Apostles, and supposed to have been collected by St. Clement, whose name they bear. Their authenticity has been greatly questioned.

"*Constitution*, properly speaking in the sense of the civil law, is that law which is made and ordained by some king or emperor; yet the canonists, by adding the word sacred to it, make it to signify the same as an ecclesiastical canon." — *Aylife: Parergon Juris Canonici.*

3. *Scots Law:*

Decree of Constitution: A decree by which the extent of a debt or obligation is ascertained. The term is generally applied to those decrees which are requisite to found a title in the person of the creditor in the event of the death of the debtor or the original creditor. (*Ogilvie.*)

¶ *Constitutions of Clarendon:*

Ch. & Civil Hist.: Constitutions, in the sense of laws or regulations, made at a Council held at Clarendon, near Salisbury, on January 25, 1164. They were designed to define the boundary-line between civil and ecclesiastical jurisdiction, and did so in a sense favourable to the civil power. On this account Thomas a Becket, Archbishop of Canterbury, refused to sign them, and excommunicated many of the ecclesiastics who had done so. This led to the feud between him and the civil government which ultimately caused his assassination, on December 29, 1170.

¶ (1) Crabb thus discriminates between *constraint* and *restraint:* "*Constraint* respects the movements of the body only; *restraint* those of the mind, and the outward actions: when they both refer to the outward actions, we say a person's behaviour is *constrained*; his feelings are *restrained:* he is *constrained* to act or not to act, or to act in a certain manner; he is *restrained* from acting at all, if not from feeling: the conduct is *constrained* by certain prescribed rules, by discipline and order; it is *restrained* by particular motives: whoever learns a mechanical exercise is *constrained* to move his body in a certain direction; the fear of detection often *restrains* persons from the commission of vices more than any sense of their enormity. The behaviour of children must be more *constrained* in the presence of their superiors than when they are by themselves: the angry passions should at all times be *restrained.*"

(2) He thus discriminates between *constraint* and *compulsion:* "There is much of binding in *constraint*; of violence in *compulsion: constraint* prevents from acting agreeably to the will; *compulsion* forces to act contrary to the will: a soldier in the ranks moves with much *constraint*, and is often subject to much *compulsion* to make him move as is desired. *Constraint* may arise from outward circumstances; *compulsion* is always produced by some active agent: the forms of civil society lay a proper *constraint* upon the behaviour of men so as to render them agreeable to each other; the arm of the civil power must ever be ready to compel those who will not submit without *compulsion:* in the moments of relaxation, the actions of children should be as free from *constraint* as possible, which is one means of lessening the necessity for *compulsion* when they are called to the performance of their duty." (*Crabb: Eng. Synon.*)

¶ *Constriction* binds by means of the physiological operation of the vessel acted upon; *compression* is produced by external force. Now, however, the public have quite learned the term, and extended it to the Asiatic Pythons, or, indeed, to any large snake. [Boa Constrictor.] The term Constrictor implies that the Boa so designated compresses, contracts, or even crushes any unfortunate animal or human being which it has succeeded in encircling within its deadly folds.

2. *Anat.:* Any muscle which compresses or contracts a tube, vessel, or organ in the body. Thus the pharyngeal wall is invested by an *inferior*, a *middle*, and a *superior constrictor.* There are also a *constrictor isthmi faucium* and a *constrictor urethræ.* (*Quain.*)

[Homoousios.] To this the corresponding Latin term was *consubstantialis.* The Greek and Roman Churches, as well as those of England and Scotland with the leading Continental Protestant Churches, still adopt this view; thus the second of the Thirty-nine Articles commences, "The Son, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God and *of one substance with the Father* . . ." Similarly the Westminster Confession of Faith—the standard of the proper Presbyterian Churches—teaches that "In the unity of the Godhead there be three persons *of one substance* . . ." 2. *Theology & Church History:*

(1) *Theol.:* The doctrine that in the Holy Eucharist the real body and blood of Christ are present along with the bread and wine. The doctrine of Transubstantiation is that when the words of consecration are pronounced by the priest the bread and wine are changed into the body and blood of Christ, and consequently cease to exist in their original substance. The doctrine of Consubstantiation, on the contrary, is that after consecration they continue to exist in their original substance, but that along with them the actual body and blood of Christ exist and are partaken of by the communicants.

(2) *Ch. Hist.:* It is believed that the first to promulgate the doctrine of Consubstantiation was John, surnamed Pungens Asinus, a doctor of Paris, at the end of the thirteenth century. Luther either adopted or thought it out anew for himself, and it will for ever be identified with his name. It was adopted also by Melanchthon and most of the other North German reformers, except Carlstadt, and became the creed of the Lutheran Church. It is taught in the tenth article of the Augsburg Confession, which asserts that the real body and blood of Christ are truly present in the Eucharist, under the elements of the bread and wine, and are distributed and received. Ulrich Zwingle, and subsequently Calvin, with most of the other Swiss and South German reformers, on the contrary, considered that the sacramental elements were merely symbolic of the body and blood of Christ, which were not corporeally present in the Eucharist. Bitterness of feeling arose between the combatants on the respective sides, and efforts to reconcile them failed. The doctrine of consubstantiation is still held as a fundamental tenet by the Lutheran Churches. It is sometimes called Impanation (q.v.).

In this case *consuls* would be those who sit together.]

1. *Roman History*:

(1) *Properly* (*Pl.*, Consuls): Two supreme magistrates, with equal authority, elected annually in ancient Rome from the time of the expulsion of the kings and the commencement of the republic (A.U.C. 244; B.C. 509). They were called at first *prætors* (prætors), *imperatores* (commanders), and *judices* (judges); but ultimately the name *consules* (consuls) prevailed over these designations. The annual meeting or assembly of the Roman citizens for their election was called by the plural term *comitia*, from the *comitium*, a place in or near the forum, where the elections were held. They continued, with a few exceptional elections, during the whole period of the republic, and were so important in the State, that the successive years were distinguished by the consuls who had held office during each of them. At first none but patricians could hold the dignity, but in B.C. 366 a plebeian was elected one of the consuls, and in B.C. 172 two. The consulate nominally continued under the empire, but was little more than a titular dignity. Tiberius transferred the power of electing consuls from the people to the senate. Afterwards their number was augmented. The last consul at Rome was Decimus Theodorus Paulinus in A.D. 536; the last at Constantinople, Basilius junior in A.D. 541.

(2) A senator (of Venice).

3. *Comm.*: An officer appointed by the government of his country to reside in a specified foreign land, with the view of promoting the mercantile interests of the nation in whose service he is engaged. On arriving at his destination, or on his being appointed a consul—if he be a native of the land in which he is accredited, he shows his credentials to the government of the region in which he is to reside, and obtains an exequatur [Exequatur] sanctioning his appointment, and according him all the rights and privileges enjoyed by his predecessors. He annually or more frequently reports to his government the state of commerce in the region where his opportunities of observation lie. The office of consul in this sense seems to have arisen in Italy about the middle of the twelfth century, and by the sixteenth had spread over Europe.

consul-general, *s.* A consul of higher official dignity than ordinary, who has jurisdiction over ordinary consuls or at more places than the one in which he ordinarily resides; a chief consul.

cŏn-sūm'-a-ble, *a.* [Eng. *consum(e); -able.*] Capable of being consumed; susceptible of consumption or total destruction; fit for consumption.

cŏn-sūme', *v.t. & i.* [O. Fr. *consumer*; Sp. *consumir*; Ital. *consumare*, from Lat. *consumo* = to take up wholly, to consume: *con-* *cum* = with, together, fully, and *sumo* = to take.]

¶ Crabb thus discriminates between *to consume, to destroy,* and *to waste:* "The idea of bringing that to nothing which has been something is common to all these terms. What is *consumed* is lost for any future purpose; what is *destroyed* is rendered unfit for any purpose whatever: *consume* may therefore be to *destroy* as the means to the end; things are often *destroyed* by being *consumed:* when food is *consumed* it serves the intended purpose; but when it is *destroyed* it serves no purpose, and is likewise unfit for any. When iron is *consumed* by rust, or the body by disease, or a house by the flames, the things in these cases are literally destroyed by *consumption:* on the other hand, when life or health is taken away, and when things are either worn or torn so as to be useless, they are *destroyed.* In the figurative signification it is synonymous with *waste:* the former implies a reducing to nothing; the latter conveys also the idea of misuse: to *waste* is to *consume* uselessly: much time is *consumed* in complaining, which might be employed in remedying the evils complained of; idlers *waste* their time because they do not properly estimate its value: those who *consume* their strength and their resources in fruitless endeavours to effect what is impracticable, are unfitted for doing what might be beneficial to themselves." (*Crabb: Eng. Synon.*)

¶ Crabb thus discriminates between *consummate* and *complete:* "As epithets, *consummate* is employed only in a bad sense, and *complete* either in a good or bad sense: those who are regarded as *complete* fools are not unfrequently *consummate* knaves: the theatre is not the only place for witnessing a farce; human life affords many of various descriptions; among the number of which we may reckon those as *complete* in their kind, which are acted at elections, where *consummate* folly and *consummate* hypocrisy are practised by turns [?]." ¶ Crabb thus discriminates between *consummation* and *completion:* "The arrival at a conclusion is comprehended in both these terms, but they differ principally in application; wishes are *consummated;* plans are *completed:* we often flatter ourselves that the *completion* of all our plans will be the *consummation* of all our wishes, and thus expose ourselves to grievous disappointments: the *consummation* of the nuptial ceremony is not always the *consummation* of hopes and joys; it is frequently the beginning of misery and disappointment: we often sacrifice much to the *completion* of a purpose which we afterwards find not worth the labour of attaining." (*Crabb: Eng. Synon.*)

2. *Medicine:*

(1) *Hist.:* A disease called by the Greeks φθίσις (*phthisis*) = a decline, a decay, a wasting away, from φθίω (*phthiō*) = to decay, to dwindle. The Romans retained the Greek word *phthisis*, though they had also a word of their own, *consumptio:* from the Latin came the English word Consumption. [Etym.]. Phthisis in medicine became a genus, with the proper meaning of wasting away, and under it were reckoned various species, as *Phthisis pulmonalis, P. hepatica, &c.* Consumption also is a genus, with at least two species, one the *Pulmonary* and the other the *Mesenteric* form.

(2) *Symptoms, &c.:* Consumption is popularly supposed to be produced by a neglected cold, inflammation of the lungs, or the breaking of a blood-vessel. In most cases these are the effects of the disease, not its causes. Its remote origin is often hereditary tendency or constitutional proclivity. In the former case the skin in childhood has a pale pasty look, the upper lip is large, and the cheeks full. If the complexion be dark the colour is sallow; if fair, it is unnaturally white, with large conspicuous veins: those who are fair being sometimes very beautiful, those who are dark generally the reverse. The circulation in both cases is languid, and the strength as a rule small. There is generally mental precocity in the fair, whilst there are often dulness and stupidity in the dark. Sooner

or later "tubercle" is deposited at the apex of one of the lungs, just beneath the shoulder-bone. [TUBERCLE.] The irritation which it causes produces a dry cough, soon followed by more or less difficulty of breathing. Expectoration next takes place when the cough comes, the matter ejected being, in the earliest stage, frothy-like saliva, then with specks of opaque matter, then wholly tenacious, and at times streaked with blood. The original tubercles are now breaking, but others are commencing, the disease travelling downwards till it pervades the whole lobe of the lung, after which a similar process tends to begin in the remaining lung. Long before this, however, the whole constitution has sympathised with the local injury. There are hectic fever, night perspirations, emaciation, and other symptoms, till the scene is closed by œdema of the lower limbs, aphthæ (small ulcers) in the mouth, mild delirium, and death. The mean duration of the disease from the first deposition of tubercle is twenty-three months, but in more than one-half the cases the fatal result takes place within nine months and often within four. There are various types of it, specially an acute, a chronic, and a latent type. It exists in all countries of the world, but not equally in all. Certain climatic conditions seem highly useful in the treatment of consumption, such as those of the mountains of Colorado and of North Carolina, with other districts of the United States, the eastern section of the Cape of Good Hope, parts of India, Australia, and New Zealand and other localities. In many countries consumption causes one-fifth or more of all the deaths that occur The mortality is greatest between the ages of twenty and forty.

That this disease is produced by bacilli is now widely held by medical men, and there has been considerable discussion as to whether or not it is contagious. Though this question has not been satisfactorily settled, definite measures of precaution against contagion are being taken in some of our cities. Tuberculous cows are being killed to prevent the communication of the disease by means of milk, and steps have been taken to prevent contagion by the dried sputum of patients, which has been found to be full of bacilli.

¶ Crabb thus discriminates between *contact* and *touch*: "The former expresses a state, and referring to two bodies actually in that state: the latter on the other hand implying the abstract act of *touching*: we speak of things coming or being in *contact*, but not of the *contact* instead of the *touch* of a thing: the poison which comes from the poison-tree is so powerful in its nature, that it is not necessary to come in *contact* with it in order to feel its baneful influence; some insects are armed with stings so inconceivably sharp, that the smallest *touch* possible is sufficient to produce a puncture into the flesh." 1. *Med. & Ord. Lang.:*

(1) The communication of a disease by contact with the person labouring under it, as distinguished from infection, used to signify its transmission by means of the air without actual personal contact with the diseased person. But sometimes the word contagion is used in both of these senses, and is divided into *immediate* or *contactical* contagion, that produced by actual contact, and *mediate* or *remote* contagion, communicated by the air. Infection is used in a more extensive sense, to include also miasmata or other causes of diseases not coming from human beings, but rising from marshes or from any other source. Some make the two words contagion and infection strictly synonymous.

(2) The poisonous matter communicated by contact of some kind.

* (3) Venom, poison.

"I'll touch my point with this *contagion*."—*Shakesp.: Hamlet*, iv. 7.

2. *Ord. Lang. & Fig.:*

(1) The communication by other people of anything deleterious to the mind or heart.

"Nor will the goodness of intention excuse the scandal and *contagion* of example."—*King Charles.*

(2) The deleterious influence exerted.

"There, in his commerce with the liveried herd,
Lurks the *contagion* chiefly to be fear'd."
Cowper: Tirocinium.

¶ Crabb thus discriminates between *contagion* and *infection*: "Some things act more properly by *contagion*, others by *infection*: the more powerful diseases, as the plague or yellow fever, are communicated by *contagion*; they are therefore denominated *contagious*; the less virulent disorders, as fevers, consumptions, and the like, are termed *infectious*, as they are communicated by the less rapid process of *infection*: the air is *contagious* or *infectious* according to the same rule of distinction; when heavily overcharged with noxious vapours and deadly disease, it is justly entitled *contagious*, but in ordinary cases *infectious*. In the figurative sense, vice is for the same obvious reason termed *contagious*; and bad principles are denominated *infectious*: some young people, who are fortunate enough to shun the *contagion* of bad society, are, perhaps, caught by the *infection* of bad principles, acting as a slow poison on the moral constitution." (*Crabb: Eng. Synon.*)

II. *Fig.:* Communicating anything from one to another or to others.

¶ (1) *Contagious Diseases Acts:* Acts passed from 1865 to 1868 to prevent the spread of venereal disease in garrison towns. Though a Royal Commission and a Select Committee reported in favour of these Acts, public feeling against them was so strong that in 1883 they were repealed.

(2) *Contagious Diseases (Animals) Acts:* Acts passed for the protection of horses, cattle, sheep, goats, and swine, from certain contagious diseases, and enforced by orders issued from time to time by the Privy Council, which also regulates the landing and slaughter of foreign cattle.

¶ Crabb thus discriminates between *contagious, epidemical,* and *pestilential:* "The *contagious* applies to that which is capable of being caught, and ought not, therefore, to be touched; the *epidemical* to that which is already caught or circulated, and requires, therefore, to be stopped; the *pestilential* to that which may breed an evil, and is, therefore, to be removed: diseases are *contagious* or *epidemical;* the air or breath is *pestilential.* They may all be applied morally or figuratively in the same sense. We endeavour to shun a *contagious* disorder, that it may not come near us; we endeavour to purify a *pestilential* air, that it may not be inhaled to our injury: we endeavour to provide against *epidemical* disorders, that they may not spread any farther. Vicious example is *contagious:* certain follies or vices of fashion are *epidemical;* the breath of infidelity is *pestilential.*" (*Crabb: Eng. Synon.*)

3. To conduct or bear oneself; to act.

"That komeli knight *kunteyned* on his stede."
William of Palerne, 3,300.

¶ Crabb thus discriminates between *to contain* and *to hold:* "These terms agree in sense, but differ in application; the former is by comparison noble, the latter is ignoble in its use; *hold* is employed only for the material contents of hollow bodies; *contain* is employed for the moral or spiritual contents: in familiar discourse a cask is said to *hold,* but in more polished language it is said to *contain* a certain number of gallons. A coach *holds* or *contains* a given number of persons; a room *holds* a given quantity of furniture; a house or city *contains* its inhabitants." (*Crabb: Eng. Synon.*)

¶ For the difference between *to contain* and *to comprise,* see COMPRISE.

cŏn-tāin′-ă-ble, *a.* [Eng. *contain; -able.*] Capable of being contained.

cŏn-tăm′-ĭn-āte, *v.t.* [Lat. *contaminatus,* pa. par. of *contamino* = to defile; *contamen* = contagion.] [CONTACT.] To defile, to sully, to pollute; to corrupt, to tarnish. (Generally used figuratively.)

". . . shall we now
Contaminate our fingers with base bribes?"
Shakesp.: Julius Cæsar, iv. 3.

¶ Crabb thus discriminates between *to contaminate, to pollute, to defile,* and *to taint:* "*Contaminate* is not so strong an expression as *defile* or *pollute;* but it is stronger than *taint;* these terms are used in the sense of injuring purity: *corrupt* has the idea of destroying it. Whatever is impure *contaminates,* what is gross and vile in the natural sense *defiles,* and in the moral sense *pollutes;* what is contagious or infectious *corrupts;* and what is *corrupted* may *taint* other things. Improper conversation or reading *contaminates* the mind of youth; lewdness and obscenity *defile* the body and *pollute* the mind; loose company *corrupts* the morals; the coming in contact with a *corrupted* body is sufficient to give a *taint.*" (*Crabb: Eng. Synon.*)

***cŏn-tĕm′-ĕr-āte,** *a.* [Lat. *contemeratus,* pa. par. of *contemero* = to defile: *con* = *cum* = with, together, fully; *temero* = to treat rashly, to defile.] Defiled, contaminated, polluted, violated.

cŏn-tĕmn′ (*n* silent), ***con-temne, *con-tempne,** *v.t.* [O. Fr. *contemner;* Ital. *contemnere,* from Lat. *contemno* = to despise: *con* = *cum* = with, together, wholly; *temno* = to despise.]

1. To despise, to view with contempt or disdain; to scorn.

"She that asks
Her dear five hundred friends *contemns* them all."
Cowper: The Task, bk. ii.

2. To slight, to reject, to neglect.

"Because they rebelled against the words of God, and *contemned* the counsel of the most High . . ."—*Ps.* cvii. 11.

¶ Crabb thus discriminates between *to contemn, to despise, to disdain,* and *to scorn:* "*Contempt,* as applied to persons, is not incompatible with a Christian temper when justly provoked by their character; but *despising* is distinctly forbidden and seldom warranted. Yet it is not so much our business to *contemn* others as to *contemn* that which is *contemptible;* but we are not equally at liberty to *despise* the person, or any thing belonging to the person, of another. Whatever springs from the freewill of another may be a subject of *contempt;* but the casualties of fortune or the gifts of Providence, which are alike independent of personal merit, should never expose a person to be *despised.* We may, however, *contemn* a person for his impotent malice, or *despise* him for his meanness. Persons are not *scorned* or *disdained,* but they may be treated with *scorn* or *disdain;* they are both improper expressions of *contempt* or *despite; scorn* marks the sentiment of a little

vain mind; *disdain* of a haughty and perverted mind. A beautiful woman looks with *scorn* on her whom she *despises* for the want of this natural gift. The wealthy man treats with *disdain* him whom he *despises* for his poverty." (*Crabb: Eng. Synon.*)

* **con-tem-nand-lie,** *adv.* [North Eng. & Scotch *contemnand*, pr. par. of *contemn*; *-ly.*] Contemptuously, in contempt of a law or order.

"*Contemplant* Spirits! ye that hover o'er . . ."

cŏn-tĕm'-plāte, or **cŏn'-tĕm-plāte,** *v.t.* & *i.* [Lat. *contemplatus*, pa. par. of *contemplor* = to observe; first used of the augurs who attended the temples of the gods: *con* = *cum* = with, together, and *templum* = a temple, a space marked out for the observation of auguries; Fr. *contempler.*]

A. *Transitive:*

I. *Lit.:* To look at, to view, to observe.

Our spirits to the size of that they *contemplate.*"

II. *Figuratively:*

(1) Followed by *over* before the subject meditated on.

(2) Followed by *on.*

"How can I consider what belongs to myself, when I have been so long *contemplating on* you."—*Dryden: Juvenal*, Pref.

2. To look for, to expect, to purpose.

¶ Crabb thus discriminates between *to contemplate*, *to meditate*, and *to muse:* "We *contemplate* what is present or before our eyes; we *meditate* on what is past or absent. The heavens and all the works of the Creator are objects of *contemplation*; the ways of Providence are fit subjects for *meditation*. One *muses* on the events or circumstances which have been just passing. We may *contemplate* and *meditate* for the future, but never *muse*. In this case the two former terms have the sense of contriving or purposing: what is *contemplated* to be done is thought of more indistinctly than when it is *meditated* to be done; many things are had in *contemplation* which are never seriously *meditated* upon: between *contemplating* and *meditating* there is oftener a greater distance than between *meditating* and executing. *Meditating* is a permanent and serious action; *musing* is partial and unimportant: *meditation* is a religious duty, it cannot be neglected without injury to a person's spiritual improvement; *musing* is a temporary employment of the mind on the ordinary concerns of life, as they happen to excite an interest for the time." (*Crabb: Eng. Synon.*)

A person may have a *contemplative* turn, or be in a *musing* mood." (*Crabb: Eng. Synon.*)

II. *Technically:*

1. *Hist.:* The term is sometimes used of persons existing at the same time, but not of the same age; the whole life of the one in such a case is not contemporaneous with the whole life of the other, but only a part of it is so.

2. *Geol.:* Formerly strata found partly with identical, partly with allied fossils, were held to be exactly contemporary, though

widely separated on the earth's surface; now the same facts are used to establish the contrary conclusion. If each species came into existence at a certain spot on the earth's surface, from which it gradually spread in various directions, it cannot have reached a remote region till some considerable time after its birth. Two strata, then, widely separated in the world, containing some species common to both, are contemporaneous in this sense, that they were formed while that species lived; but the stratum near its birthplace is older than the one to which it spread after it had already multiplied greatly and rooted itself successively in all the intervening regions, wherever a place appropriate for its habitation could be found.

* 3. An insult, an act expressive of contempt or disdain.

"After my fancy had run over the most obvious and common calamities which men of mean fortunes are liable to, it descended to these little insults and *contempts*, ..."—*Spectator*, No. 150.

II. *Technically:*

1. *Law:* An act of disobedience to the rules, orders, or regulations of a court or legislative assembly; a failure to carry out the order of a court; disorderly conduct or language tending to disturb the proceedings of any court or legislative assembly. Contempt, when committed outside the court itself, is punishable by an attachment; when inside, which is of course a more aggravated offence than the former, it is punishable summarily by fine or imprisonment. Contempt of the sovereign's person is also a penal offence. A similar manifestation towards the government was once penal too, but every successive administration now expects much abuse from politicians of opposite politics to its own, and never thinks of bringing them to justice.

2. *Parliamentary law and usage:* Contempt of either House of Congress can be punished by the House insulted, which has the power of committing the offender.

* **cŏn-tĕmpt'-fŭl** (*p* silent), *a.* [Eng. *contempt; -ful(l).*] Deserving of contempt or scorn; contemptible.

* **cŏn-tĕmp-tĭ-bĭl'-ĭt-ў** (*p* silent), *s.* [Eng. *contemptible; -ity.*] The quality or condition of being held in or considered worthy of contempt; despicableness.

"The *contemptibility* and vanity of this effeminate argument ..."—*Speed: Edward II.*, bk. ix., ch. xi.

cŏn-tĕmpt'-ĭ-ble (*p* silent), *a.* [Lat. *contemptibilis*, from *contemptus.*]

1. Worthy of contempt or scorn; despicable, mean.

"Besides, how vile, *contemptible*, ridiculous."
Milton: Samson Agonistes, 1,361.

2. Despised, scorned.

"The loss of a faithful creature is something, though of ever so *contemptible* a one ..."—*Pope: Letter to H. Cromwell* (1709).

* 3. Feeling or expressing contempt; scornful, contemptuous

"If she should make tender of her love, 'tis very possible he'll scorn it; for the man ... hath a *contemptible* spirit."—*Shakesp.: Much Ado*, ii. 3.

¶ Crabb thus discriminates between *contemptible, pitiful*, and *despicable:* "A person may be *contemptible* for his vanity or weakness; but he is *despicable* for his servility and baseness of character; he is *pitiful* for his want of manliness and becoming spirit. A lie is at all times *contemptible;* it is *despicable* when it is told for purposes of gain or private interest; it is *pitiful* when accompanied with indications of unmanly fear. It is *contemptible* to take credit to one's self for the good action one has not performed; it is *despicable* to charge another with the faults which we ourselves have committed; it is *pitiful* to offend others, and then attempt to screen ourselves from their resentment under any shelter which offers. It is *contemptible* for a man in a superior station to borrow of his inferiors; it is *despicable* in him to forfeit his word; it is *pitiful* in him to attempt to conceal by artifice." (*Crabb: Eng. Synon.*)

¶ For the difference between *contemptible* and *contemptuous*, see CONTEMPTUOUS.

cŏn-tĕmpt'-ĭ-ble-nĕss (*p* silent), *s.* [Eng. *contemptible; -ness.*] The quality or state of being contemptible or worthy of scorn and contempt; meanness, vileness, baseness.

Contemptuous, proud, set on revenge and spite."
Milton: Samson Agonistes, 1,462.

* 3. Despised, contemned.

"Last of all, the *contemptuous* Samarican."—*Vocacyon of Johan Bale* (1553). (*Davies.*)

¶ Crabb thus discriminates between *contemptible* and *contemptuous:* "*Contemptible* is applied to the thing deserving contempt: *contemptuous* to that which is expressive of contempt. Persons, or what is done by persons, may be *contemptible* or *contemptuous;* but a thing is only *contemptible.* A production is *contemptible;* a sneer or look is *contemptuous.*" (*Crabb: Eng. Synon.*)

* **cŏn'-tĕn-ançe,** * **con-ten-anse,** * **con-ten-aunce,** *s.* [COUNTENANCE, *s.*]

* **con-ten-ci-on,** *s.* [CONTENTION.]

cŏn-tĕnd', *v.i.* & *t.* [Fr. *contendre;* Sp. & Port. *contender*, from Lat. *contendo: con* = *cum* = with, together, and *tendo* = to stretch.]

A. *Intransitive:*

1. To struggle, to strive in opposition.

Which should be thine or his."
Shakesp.: Macbeth, i. 3.

2. To exert oneself or strive in defence or support of anything. (With *for.*)

3. To strive in debate; to dispute or argue; to support an opinion or statement.

(*a*) With *for* before the opinion, &c., supported.

* 4. To reprove, to chide, to find fault.

* 5. To exert oneself.

"Arise, *contend* thou before the mountains, and let the hills hear thy voice."—*Micah* vi. 1.

* 6. To use power or strength upon; to punish.

"... behold, the Lord God called to *contend* by fire, and it devoured the great deep, and did eat up a part."—*Amos* vii. 4.

* **B.** *Trans.:* To contend or struggle for; to dispute, to contest.

"Their airy limbs in sports they exercise,
And on the green *contend* the wrestler's prize."
Dryden: Virgil; Æneid vi. 874.

¶ (1) Crabb thus discriminates between to *contend*, to *contest*, and to *dispute:* "*Contend* is to *contest* as the genus to the species. To *contest* is a species of *contending;* we cannot *contest* without *contending*, although we may *contend* without *contesting.* To *contend* is confined to the idea of setting one's self up against another; *contest* and *dispute* must include some object *contested* or *disputed. Contend* is applied to all matters, either of personal interest or speculative opinion; *contest* always to the former; *dispute* mostly to the latter. Individuals or distinct bodies *contend;* nations *contest.* During the present long and eventful *contest* between England and France, the English have *contended* with their enemies as successfully by land as by sea. Trifling matters may give rise to *contending;* serious points only are *contested. Contentions* are always conducted personally, and in general verbally; *contests* are carried on in different manners according to the nature of the object. The parties themselves

mostly decide *contentions;* but *contested* matters mostly depend upon others to decide."

(2) He thus discriminates between to *contend*, to *strive*, and to *vie:* "*Contending* requires two parties: *strive* either one or two. There is no *contending* where there is not an opposition; but a person may *strive* by himself. *Contend* and *strive* differ in the object as well as the mode: we *contend* for a prize; we *strive* for the mastery: we *contend* verbally; but we never *strive* without an actual effort, and labour more or less severe. We may *contend* with a person at a distance; but *striving* requires the opponent, when there is one, to be present. Opponents in matters of opinion *contend* for what they conceive to be the truth; sometimes they *contend* for trifles: combatants *strive* to overcome their adversaries, either by dint of superior skill or strength. *Contend* is frequently used in a figurative sense, in application to things; *strive* very seldom. We *contend* with difficulties; and in the spiritual application, we may be said to *strive* with the spirit. *Vie* has more of *striving* than *contending* in it; we *strive* to excel when we *vie*, but we do not *strive* with any one; there is no personal collision or opposition: those we *vie* with may be as ignorant of our persons as our intentions. *Vying* is an act of no moment, but *contending* and *striving* are always serious actions: neighbours often *vie* with each other in the finery and grandeur of their house, dress, and equipage." (*Crabb: Eng. Synon.*)

"I did not say that the Book of Articles only was the *continent* of the Church of England's publick doctrine."—*Archbishop Laud: Conference with Fisher*, p. 50.

II. *Technically:*

1. *Geog.:* A vast tract of land so much detached from the rest of the land in the world as to render it expedient to give it a distinctive name. There are generally said to be four continents: Europe, Asia, Africa, and America, to which some add a fifth, Australia. The division is, to a certain extent, arbitrary. Europe is not detached from Asia, but is continuous with it for about two thousand miles; whilst, on the contrary, North and South America are so dissevered that they should have received separate names, and figured as two continents instead of one. If Africa be taken as the type of a continent, then a continent differs from an island in not being wholly detached from the continents adjacent to it; but if America be regarded as the type of a continent, then a continent differs from an island only in being larger. Really, Europe, Asia, and Africa together constitute one island, by far the largest in the world; America a second, the next largest; and Australia another, the third largest; their size renders them worthy of being called continents.

2. *Geol.:* In essentially the same sense as B. I. 1. As the action of water tends to wash away all land and deposit it beneath the waves of the sea, whilst igneous agency, operating through volcanoes and earthquakes, and generally in the vicinity of the ocean, tends to heave it up, it is evident that if a sufficient length of time be given the continents will change their places, and they have done so in time past. This, to a certain extent, was understood by the ancient philosophers.

"The face of places, and their forms, decay.
And that is solid earth, that once was sea:
Seas, in their turn, retreating from the shore,
Make solid land what ocean was before;
And far from strands are shells of fishes found
And rusty anchors fix'd on mountain ground."
Dryden: Trans. from Ovid's Metamorphoses: The Pythagorean Philosophy.

Murchison considered that the original continents had been mostly submerged. Lyell founded his hypothesis, designed to explain the changes of climate in bygone geologic periods, by supposing successive gradual redistributions of sea and land quite different from those now prevailing. [CLIMATE.] Prof. Edward Forbes considered it probable that a "great Miocene land," by which he meant a land consisting of Miocene beds, subsequently upheaved, extended into the Atlantic far past the Azores, Great Britain, Ireland, and Spain, being parts of it. (*Mem. Geol. Surv. Great Brit.*, vol. i.; *Q. J. Geol. Soc.*, vol. iii., pt. i., pp. lv.—lxviii.) Still, what may be called the nuclei of existing continents have existed since a remote geological period, though they have been submerged from time to time.

cŏn-tĭn-ĕnt'-al, *a.* [Eng. *continent*; *-al*; Fr. *continental.*] Pertaining to a continent, esp. to the continent of Europe.

"The union of two great monarchies under one head would doubtless be opposed by a *continental* coalition."—*Macaulay: Hist. Eng.*, ch. ii.

¶ *Continental system:*

Hist.: A project planned, and to a certain extent carried temporarily into effect, of cutting off Britain from all connexion with the Continent of Europe, with the view, if possible, of striking a mortal blow at her maritime and commercial supremacy. The first mention of it occurs in the armistice of Foligno, February 18, 1801, but it was not thoroughly developed till the issue of the Berlin Decree, November 19, 1806. This placed the British islands in a state of blockade [BLOCKADE, II.], forbade all commerce with them, made all goods coming from Britain or its colonies contraband, ordered all letters to or from it to be opened, and all British subjects to be arrested. All the Continental nations to which Napoleon could dictate were forced to carry out his system whether they liked it or no. Britain retaliated by successive Orders in Council, and finally the restiveness of the nations under the insupportable inconvenience produced by the decrees, not merely caused their practical abandonment, but aided in a considerable degree in producing the fall of Napoleon.

Math.: Quantities or magnitudes in continued proportion (q.v.).

¶ (1) Crabb thus discriminates between *continual* and *continued:* "Both these terms mark length of duration, but the former admits of a certain degree of interruption, which the latter does not. What is *continual* may have frequent pauses; what is *continued* ceases only to terminate. Rains are *continual;* noises in a tumultuous street are *continual:* the bass in music is said to be *continued;* the mirth of a drunken party is one *continued* noise. *Continual* interruptions abate the vigour of application and create disgust: in countries situated near the poles, there is one *continued* darkness for the space of five or six months; during which time the inhabitants are obliged to leave the place. *Continual* respects the duration of actions only; *continued* is likewise applied to the extent or course of things: rumours are *continual;* talking, walking, running, and the like, is *continual;* but a line, a series, a scene, or a stream of water, is *continued.*"

(2) He thus discriminates between *constant, continual,* and *perpetual:* "What is *continual* admits of no interruption: what is *perpetual* admits of no termination. There may be an end to that which is *continual,* and there may be intervals in that which is *perpetual.* Rains are *continual* in the tropical climates at certain seasons; complaints among the lower orders are *perpetual,* but they are frequently without foundation. There is a *continual* passing and repassing in the streets of the metropolis during the day; the world, and all that it contains, are subject to *perpetual* change. *Constant,* like *continual,* admits of no interruption; but it may cease altogether. *Continual* respects the outward circumstances and events; *constant* the temper of mind." 2. *United States:* The deferring of a trial or suit from one stated term of the court to another. (*Webster.*)

¶ Crabb thus discriminates between *continuance, continuation,* and *duration:* "*Continuance* and *duration* are both employed for time; things may be of long *continuance,* or of long *duration:* but *continuance* is used only with regard to the conduct of men; *duration* with regard to the existence of every thing. Whatever is occasionally done, and soon to be ended, is not for a *continuance;* whatever is made, and soon destroyed, is not of long *duration;* there are many excellent institutions in England which promise to be of no less *continuance* than of utility. *Duration* is with us a relative term; things are of long or short *duration:* by comparison, the *duration* of the world and all sublunary objects is nothing in regard to eternity." (*Crabb: Eng. Synon.*)

3. An extension or prolongation; as, the *continuation* of a line.

II. *Figuratively:*

"A sleek man ... in drab shorts and *continuations*."—*Dickens: Sketches by Boz.*

¶ (1) Crabb thus discriminates between *continuation, continuity,* and *continuing:* "*Continuation* is the act of *continuing; continuity* is the quality of *continuing:* the former is employed in the figurative sense for the duration of events and actions; the latter in the physical sense for the adhesion of the component parts of the bodies. The *continuation* of a history up to the existing period of the writer is the work of every age, if not of every year: there are bodies of so little *continuity* that they will crumble to pieces on the slightest touch."

(2) For the difference between *continuation* and *continuance*, see CONTINUANCE.

3. To protract, extend, or lengthen; to draw out.

"The dark abyss, whose boiling gulph

2. To endure; to last or be durable.

". . . thy kingdom shall not *continue* . . ."—1 *Sam.* xiii. 14.

3. To persevere or persist, not to omit or cease.

". . . they *continued* not in my covenant, . . ."—*Heb.* viii. 9.

4. Not to leave off.

". . . they *continued* to occupy their old positions."—*Macaulay: Hist. Eng.*, ch. xix.

5. To remain in connection with, not to leave or forsake.

"They went out from us, but they were not of us; for if they had been of us, they would no doubt have *continued* with us . . ."—1 *John* ii. 19.

¶ (1) Crabb thus discriminates between *to continue, to remain,* and *to stay:* "The idea of confining one's self to something is common to all these terms; but *continue* applies often to the sameness of action, and *remain* to the sameness of place or situation; the former has most of the active sense in it, and expresses a state of action; the latter is altogether neuter, and expresses a state of rest. We speak of *continuing* a certain course, of *continuing* to do, or *continuing* to be any thing; but of *remaining* in a position, in a house, in a town, in a condition, and the like. There is more of will in *continuing*; more of necessity and circumstances in *remaining*. A person *continues* in office as long as he can perform it with satisfaction to himself, and his employers: a sentinel *remains* at his post or station. *Continue* is opposed to cease; *remain* is opposed to go. Things *continue* in motion; they *remain* stationary. *Remain* and *stay* are both perfectly neuter in their sense, but *remain* is employed for either persons or things: *stay* for persons only. *Remain* is often involuntary, if not compulsory: *stay* is altogether voluntary."

(2) He thus discriminates between *to continue, to persevere, to persist, to pursue,* and *to prosecute:* "The idea of not laying aside is common to these terms, which is the sense of *continue* without any other addition; the other terms, which are all species of *continuing*, include likewise some collateral idea which distinguishes them from the first, as well as from each other. *Continue* is comparable with *persevere* and *persist* in the neuter sense; with *pursue* and *prosecute* in the active sense. To *continue* is simply to do as one has done hitherto; to *persevere* is to *continue* without wishing to change, or from a positive desire to attain an object; to *persist* is to *continue* from a determination or will not to cease. The act of *continuing*, therefore, specifies no characteristic of the agent; that of *persevering* or *persisting* marks a direct temper of mind; the former is always used in a good sense, the latter in an indifferent or bad sense. *Continue*, when compared with *persevere* or *persist*, is always coupled with modes of action; but in comparison with *pursue* or *prosecute*, it is always followed by some object: we *continue* to do, *persevere*, or *persist* in doing something: but we *continue*, *pursue*, or *prosecute* some object which we wish to bring to perfection by additional labour. *Continue* is equally indefinite, as in the former case; *pursue* and *prosecute* both comprehend collateral ideas respecting the disposition of the agent, and the nature of the object; to *continue* is to go on with a thing as it has been begun; to *pursue* and *prosecute* is to *continue* by some prescribed rule, or in some particular manner: a work is *continued*; a plan, measure, or line of conduct is *pursued*; an undertaking or a design is *prosecuted*: we may *continue* the work of another in order to supply a deficiency; we may *pursue* a plan that emanates either from ourselves or another; we *prosecute* our own work only in order to obtain some peculiar object: *continue*, therefore, expresses less than *pursue*, and this less than *prosecute*: the history of England has been *continued* down to the present period by different writers; Smollett has *pursued* the same plan as Hume, in the *continuation* of his history; Captain Cook *prosecuted* his work of discovery in three several voyages. We *continue* the conversation which has been interrupted; we *pursue* the subject which has engaged our attention; we *pursue* a journey after a certain length of stay; we *prosecute* any particular journey which is important either on account of its difficulties or its object." (*Crabb: Eng. Synon.*)

(2) *Geol.* (*Chiefly of time*): In the same sense as 1. The doctrine that there never has been a universal destruction of animal or vegetable life in bygone geologic times, and that the gaps which now occur between strata are only local, and if they appear universal, are produced not by such catastrophes as the older geologists imagined to account for them, but by deficiencies in our knowledge. Two great breaks were once supposed to exist—one between the Permian and the Triassic, which separated the palæozoic from the mesozoic or secondary rocks, and the other between the Chalk and the Eocene, separating the mesozoic and the cainozoic or tertiary. Both still exist, but intermediate rocks, called the Lignitic series, 4,000 ft. thick, have been found in America, partially filling the latter gap. It is believed that were all the existent strata, including those under the modern oceans, known, and all which have been destroyed by denudation replaced, the first and all other gaps would disappear. The doctrine of geological continuity is essential to Darwinism, but it can be and is held also by the advocates of successive separate creations. (*Nicholson, &c.*)

". . . to discuss the question of what may be called geological *continuity*."—*Nicholson: Palæont.* (2nd ed.), ii. 46.

All writers of authority on international law admit this principle; and lay it down that a nation which should furnish a belligerent with articles *contraband* of war—that is, with supplies of warlike stores or any article required for the prosecution of the war—would forfeit her neutral character, and that the other belligerent would be warranted in preventing such succours from being sent and confiscating them as lawful prize."—*McCulloch: Commercial Dictionary.*

cŏn-trīve′ (1), * **con-treve,** * **con-troeve,** * **con-trove,** *v.t. & i.* [O. Fr. *controver* = to find out, *trover* = to find; Fr. *trouver*; Ital. *trovare*, from Lat. *turbo* = to move, to seek for.]

A. *Transitive:*

¶ Crabb thus discriminates between *to contrive, to devise*, and *to invent*: "To *contrive* and *devise* do not express so much as to *invent*: we *contrive* and *devise* in small matters; we *invent* in those of greater moment. *Contriving* and *devising* respect the manner of doing things; *inventing* comprehends the action and the thing itself; the former are but the new fashioning of things that already exist; the latter is, as it were, the creation of something new: to *contrive* and *devise* are intentional actions, the result of a specific effort: *invention* naturally arises from the exertion of an inherent power; we require thought and combination to *contrive* or *devise*; ingenuity is the faculty which is exerted in *inventing*. *Contriving* requires even less exercise of the thoughts than *devising*: we *contrive* on familiar and common occasions; we *devise* in seasons of difficulty and trial. A *contrivance* is simple and obvious to a plain understanding; a *device* is complex and far-fetched; it requires a ready conception and a degree of art."

¶ (1) *Board of Control:* A board consisting of six members, established by Mr. Pitt, in 1784, for the control and legislation of India. It was abolished in 1858 on the transference of the government of India to the Crown.

The monopoly of Eastern trade granted to the old East India Company was designed simply for commercial purposes: the Government, in granting it a charter, had no conception that they were calling into existence what was ultimately to become one of the greatest military empires of the world. Nor was the Company itself aware of this: its intentions were pacific, but having to establish depôts of goods under the jurisdiction of native despots, who were accustomed, under some flimsy pretext, to help themselves to whatever in their dominions they coveted—subordinate despots following the evil example of their superiors—the agents of the Company, if they were not to be plundered wholesale, required to take some steps for their own defence. Beginning in a humble way and with reluctance to interfere for their interest in native politics, they soon found themselves in possession, first of detached territories, and ultimately of empire. When this unexpected state of things happened, it was deemed more needful than ever for the Home Government to keep a certain control over their proceedings, especially as the necessity for some of the numerous wars in which "the Company's forces" were engaged was not obvious in England. Hence the establishment of the Board of Control, which, gradually increasing its power at the expense of the Company, was often the real author of acts for which the Company were blamed. Thus the first Afghan war was forced upon the Company by the Board of Control with the sanction of the Cabinet, the Company protesting in vain against what was done. When the war was unsuccessful, and was held in other ways to have sullied the fair fame of Britain, the Company were then popularly held to have originated the hostilities commenced against their will. The mutinies and war of 1857 and 1858 having destroyed the Company's reputation and annihilated its power, the double government was abolished, the functions of the Board of Control were altered, and the Secretary of State for India, with the whole Cabinet, became the supreme government of India.

cŏn-văl-la-măr'-ĭn, *s.* [Mod. Lat. *convallaria* (q.v.), and Lat. *amarus* = bitter.]

Chem.: $C_{23}H_{44}O_{12}$. A bitter substance contained along with convallarin in *Convallaria majalis*. It is obtained by diluting and filtering the mother liquid from which the convallarin has separated, then digesting with animal charcoal, precipitating with tannic acid, and separating the tannic acid with oxide of lead. Convallamarin is a white bitter powder, easily soluble in water and in alcohol, nearly insoluble in ether. By heating the aqueous solution with dilute sulphuric acid the convallamarin is resolved into sugar, water, and convallamaretin. Nitric acid colours convallamarin yellow; strong sulphuric acid colours it violet.

Lily of the Valley: A genus of plants, order Liliaceæ, tribe Asparageæ. The only British species is *Convallaria majalis*, the sweet-scented Lily of the Valley. It has two ovate lanceolate radical leaves, a semi-cylindrical scape with racemes of very pure white fragrant flowers, with the divisions of the perianth recurved at the tips. The berries, which are globose, are red. It is found in woods and coppices, especially in a light soil, with some frequency in England, but is rarely indigenous at all in Scotland. [CONVAL.] There is a red-flowered and a double variety in gardens.

cŏn-văl'-lăr-ĭn, *s.* [Mod. Lat. *convallar(ia)*; Eng. suff. *-in.*]

Chem.: $C_{34}H_{62}O_{11}$. Obtained by collecting the plant *Convallaria majalis* during flowering time, and drying and pulverising it; it is then exhausted with alcohol, sp.gr. 0.84, the tincture precipitated by subacetate of lead, the lead removed from the filtrate by H_2S gas, convallarin separating out on evaporation. It crystallises in colourless crystals, which are insoluble in ether, readily soluble in alcohol, and which have an irritating taste; the solution in water froths when agitated.

2. *Hist.:* It is said that the first convent in England was erected by Eadbald at Folkestone in 630, and the first in Scotland at Coldingham in 670. They were numerous during the Middle Ages. Henry VIII. suppressed them, confiscating their revenues. By the Roman Catholic Emancipation Act of 1829 their erection in the United Kingdom was prohibited, but the Act was from the first so much of a dead letter that they were established in various places with no protest from the community in general. For a long time convents in Britain were founded by the Church of Rome only, but in 1875 one was opened at Bournemouth under the auspices of the Ritualist party in the Establishment. They exist somewhat widely in the United States and have, on more than one occasion, been attacked by mobs, but are ordinarily undisturbed.

[CONVENTICLE ACT.]

". . . to leave unrepealed the Act which made it death to attend a Presbyterian *conventicle*."—*Macaulay: Hist. Eng.*, ch. vi.

¶ *Conventicle Acts:*

Law & Hist.: Various Acts designed to punish those who conducted or frequented conventicles. By 35 Eliz., c. 1, passed in 1593, any persons attending such places were to be imprisoned till they conformed. If they did not conform within three months they were to abjure the realm, and if they would not do this, or if after abjuration they returned to the country again, they were to be hanged. By the Conventicle Act, 16 Chas. II., c. 4, passed in 1664, it was enacted that whenever five persons more than the inmates of the house where a conventicle was held attended it, every one of them was liable to a penalty of £5 or three months' imprisonment for the first offence, twice as much for the second, and a fine of £100 or transportation for seven years for the third. The penalties were modified by the 22 Chas. II., c. 1, passed in 1670, and the Act itself repealed by the Toleration Act, 1 Will. & Mary, c. 18, § 1, passed May 24, 1689. Similar enactments were in force in Scotland at the same period. (*Townsend, &c.*)

II. *Technically:*

1. *History and Law:* The assemblage of Conventions has been very common in the history of the United States, alike on great and on small occasions. They were frequently called during the disturbances in public feeling which preceded the Revolutionary War. Of later conventions the most important was that which formed the Constitution of the United States. Following its example, the Constitutions of the several states have been similarly formed in conventions, and they have been called on various other occasions, as in the Southern States in the period preceding the Civil War.

In Great Britain there have been Parliamentary Conventions during times of national crisis or revolution, assembled without waiting for the royal writ or sanction. Such a convention has assumed powers beyond those of an ordinary Parliament, throwing aside precedent, and reconstructing or modifying the political machinery. Such a convention was that called by General Monk, which restored Charles II. to the throne; also that which bestowed the throne of England on William of Orange.

2. *French Hist.:* The term applied to what was more fully named The National Convention, which succeeded the National Legislative Assembly on September 21, 1792, and was dissolved October 26, 1795. It commenced by abolishing royalty and proclaiming a republic, it altered the calendar, was sanguinary in its measures, and was at feud with Europe.

(2) The alteration of a muzzle-loading gun or rifle to breech-loading.

5. *Script. & Theol.:* The word *conversion* occurs only once in the Bible, but portions of the verb *to convert* occur eleven times, and the substantive *convert* once. *Conversion* is the rendering of the Greek word ἐπιστροφήν (*epistrophēn*) = literally (1) a turning about, (2) a turning towards. *Conversio* in Latin, and *conversion* in English, are the exactly correspondent words in those languages. The meaning is that a large number of the Gentiles had "turned about" so as to leave behind them their belief in the imaginary divinities of their countrymen and direct their faces towards Christianity, a spiritual and moral renovation attending their change of belief. The verb *to convert* is used of a change wrought upon a sinner's heart when he was turned from his sins to God without any change in his nominal religious professions; before and after his change of heart he remained an avowed adherent of Judaism (Psalm li. 13). Of such a change of heart the "law of the Lord" is an instrument or means (Psalm xix.), or the instrumentality may be human (James v. 19, 20). The change is attended by repentance and forgiveness (Acts iii. 19). It makes the character child-like, and none but those who have undergone this change shall enter the kingdom of heaven (Matt. xviii. 3). There are synonymous words of the same meaning; as, for instance, *turn* in Jer. xxxi. 18, where, for the production of the spiritual change described, the intervention of the Divine Being is considered to be needful, and is sought in prayer (Jer. xxxi. 18). This is the continual teaching of the New Testament (John vi. 44, xvi. 7—11; Acts ii. 26). Many theologians call the Divinely-produced spiritual change now indicated *conversion*. The 17th Article of the Church of England, while not using the term, clearly describes the idea embodied under it in the following words:—"Wherefore they which be endued with so excellent a benefit of God be called according to God's purpose by his Spirit working in due season; they through Grace obey the calling: they be justified freely: they be made the Sons of God by adoption: they be made like the image of his only begotten Son Jesus Christ: they walk religiously in good works, and at length, by God's mercy, they attain to everlasting felicity." The teaching of the Westminster Confession of Faith is conveyed in less concise language, but the meaning is in all respects the same. And with these the teachings of most Protestant confessions agree.

* **B.** *As adj.:* Converted to the true religion.

". . . circumcising the *convert* Gentiles, . . ."—*Locke: Galatians*, ch. ii., note 2.

¶ Crabb thus discriminates between *convert* and *proselyte:* "*Convert* is more extensive in its sense and application than *proselyte: convert* in its full sense includes every change of opinion, without respect to the subject; *proselyte* in its strict sense refers only to changes from one religion to another. . . . *Conversion* is a more voluntary act than *proselytism;* it emanates entirely from the mind of the agent, independent of foreign influence; it extends not merely to the abstract or speculative opinions of the individual, but to the whole current of his feelings and spring of his actions: it is the *conversion* of the heart and soul. *Proselytism* is an outward act, which need not extend beyond the conformity of one's words and actions to a certain rule: *convert* is therefore always taken in a good sense; it bears on the face of it the stamp of sincerity: *proselyte* is a term of more ambiguous meaning; the *proselyte* is often the creature and tool of a party; there may be many *proselytes* where there are no *converts.*" (*Crabb: Eng. Synon.*)

2. *Eccles.:* An assembly of the clergy. Specially the name given to either of two such gatherings, the one termed the Convocation of Canterbury, or simply Convocation, the other the Convocation of York. The Convocation in the 16th century having recognised that the king's majesty justly and rightfully is and ought to be the supreme earthly head of the Church of England, the king in that capacity has the prerogative of calling convocation together, which is done at the commencement of each session of Parliament. To a certain extent, the Convocation of Canterbury is itself framed on the Parliamentary model. It has two Houses, the Upper one (representing the Lords), consisting solely of bishops presided over by the Archbishop; the Lower one, the deans, the archdeacons, and proctors (the last-named officers being designed to represent the inferior clergy, and to present an analogy to the House of Commons). The Convocation of York less closely resembles Parliament, for it has only a single house. In mediæval times, Convocation was a much greater power than now. When the clergy of all degrees managed to exempt themselves from the general taxation of the country levied in the ordinary way, Convocation was required to assess the clerical body for the expenses of the civil government, and some have contended that this was originally its only function. Others, however, have been assigned to it, especially the enactment of canon law, and the examination and censure of heretical books or individuals. By 25 Henry VIII., c. 19, Convocation was prohibited from making any canon or ordinance which was opposed to the king's prerogative, or to the laws, customs, and statutes of the realm. By 16 & 17 Charles II., c. 1, passed in 1665, the clergy as well as the laity were required to pay their quota of taxes together, and the former were discharged from all obligation regarding the subsidies levied by Convocation. In 1716, the remaining privileges were taken away, and for a long time afterwards it remained almost in a state of suspended animation, being no sooner called together at the commencement of each session of Parliament then it was prorogued before it could do any business. In 1854, an effort began to revive Convocation and give it real power of dealing with ecclesiastical matters, but both parties in Parliament are opposed to such a revolution. However, in February, 1872, they allowed the clergy to deliberate on alterations in the liturgy, and embodied them in an Act on 5th of March of the same year.

cŏn-vŏlv-ū-lā'-cĕ-æ, *s. pl.* [Lat. *convolvulus* (q.v.), and fem. pl. adj. suff. *-aceæ*.]

Bot.: An order of perigynous exogens, placed by Lindley in his alliance Solanales. The species are generally twining and milky plants, though some are erect bushes. The leaves are often undivided. There are no stipules. Inflorescence axillary or terminal; the partial peduncles, when any exist, generally in the form of two bracts. Corolla, monopetalous, deciduous; the limb five-lobed, plaited; stamens five; ovary simple, with two or four cells, rarely with one; ovules few, erect; style one, generally divided at the top into as many segments as the cells of the ovary; capsule one to four celled, succulent or capsular. Very common in all parts of the tropics, rarer in cold countries. The roots abound in a milky juice, which is strongly purgative. It is the active principle in Jalap (*Convolvulus Jalapa*), Scammony (*C. Scammonia*), &c. [CONVOLVULUS, JALAP, SCAMMONY.] *Batatas edulis* is the Sweet Potato. [BATATAS.] There are two tribes or sections of the order: Convolvuleæ, with the carpels consolidated, and Dichondreæ, with them distinct. There are forty-six genera known and nearly 700 species. Two British genera, Convolvulus and Calystegia (q.v.); species three.

cŏn-vŏlv-ū-lā'-cĕ-ŏŭs, *a.* [Mod. Lat. *convolvulace(æ)* (q.v.), and Eng. suff. *-ous*.]

cŏn-vŏlv'-ū-lĭc, *a.* [Lat. *convolvul(us)* (q.v.), and Eng. suff. *-ic*.]

convolvulic acid, *s.*

Chem.: $C_{31}H_{54}O_{16}$. An organic acid obtained by boiling convolvulin with baryta water, then precipitating the excess of baryta with dilute sulphuric acid, removing the excess of sulphuric acid by lead carbonate, and finally removing the lead by H_2S gas. Convolvulic acid is a white amorphous bitter powder, readily soluble in water and in alcohol, insoluble in ether. Its aqueous solution is acid, and it forms salts called convolvulates. By boiling with dilute sulphuric acid, it yields sugar and convolvulinol. It is also called rhodeoretic acid.

cŏn-vŏlv'-ū-lĭn, *s.* [Lat. *convolvul(us)*, and Eng. suff. *-in* (*Chem.*) (q.v.).]

Chem.: $C_{31}H_{50}O_{16}$. Also called rhodeoretin. A colourless transparent resin contained in the rhizome of the officinal jalap root. Convolvulin is prepared by exhausting the root of *Convolvulus orizabensis* with boiling water, then drying and pulverising it, and treating it with twice its weight of ninety per cent. alcohol, mixing the alcoholic extract with water till it begins to show turbidity; then treating the liquid twice with animal charcoal, distilling the alcohol from the filtrate, repeatedly treating the residual pulverised resin (amounting to between ten and fifteen per cent. of the root) with ether; dissolving the residue in the smallest possible quantity of absolute alcohol, and precipitating with ether till the precipitate is quite free from resin soluble in ether. The residue is pure convolvulin. Convolvulin is tasteless and inodorous, nearly insoluble in water. When dry it melts at 150°, forming a yellow transparent liquid; it burns with a smoky flame. Finely divided convolvulin dissolves in aqueous alkalies, and is converted into convolvulic acid. When dissolved in alcohol it is decomposed by hydrochloric acid, yielding convolvulinol and glucose. It dissolves in strong sulphuric acid, forming a carmine colour, which afterwards turns brown and deposits a dark brown substance. Convolvulin is the active principle of jalap-resin. It exerts a very strong purgative action even in doses of a few grains. (*Watts: Dict. Chem.*, vol. ii., p. 15.)

cŏn-vŏlv'-ū-lĭn-ŏl, *s.* [Eng. *convolvulin*, and Lat. *ol(eum)*.]

Chem.: Convolvulinolic acid, rhoderetinol $(C_{13}H_{24}O_3)_2+H_2O$. Obtained by the action of dilute acids or of emulsin on convolvulic acid. It forms white inodorous needle crystals, which have a biting bitter taste, slightly soluble in water, readily soluble in alcohol; it melts at 39°. It volatilises when heated on platinum foil; the vapours cause coughing. It is oxidised by concentrated nitric acid into oxalic and ipomæic acids. Strong sulphuric acid colours it first yellow, then amaranth-red. It dissolves in alkalies, and parts with water, becoming $C_{13}H_{24}O_3$, which is considered to be the true acid; it melts at 42°. It forms salts, called convolvulinolates.

cŏn-vŏlv-ū-lĭn-ŏl'-ĭc, *a.* [Lat. *convolvul(us)*, suff. *-in* (? *Chem.*), in combination with Eng. *oleic*, from Lat. *oleum* = oil (?).]

Chem.: A term used only in the subjoined compound.

convolvulinolic acid, *s.*

Chem.: A chemical substance obtained by the action of acids or alkalies on resinous glucosides contained in the root of Jalap, *Convolvulus Schiedanus*, and of *C. orizabensis*.

cŏn-vŏlv'-ū-lŭs (pl. *convolvuli*), *s.* [Lat. = (1) a caterpillar which rolls itself up in a leaf, (2) the Bindweed. Spec. *Convolvulus sepium*.]

Bot.: A genus of plants, the typical one of the order Convolvulaceæ and the tribe Convolvuleæ. The calyx is without bracts, the corolla funnel-shaped, the capsule two-celled, each cell with two seeds. There are two British species. One is *Convolvulus arvensis:* it has a root running deeply into the ground, rendering the plant difficult of extirpation; sagittate leaves, with acute lobes; the peduncles usually single-flowered, with minute bracts distant from the flowers, which are somewhat small and pale rose-coloured. It is common in fields and hedges, especially where the soil is light. The other is *C. Soldanella*, the Sea-side Convolvulus or Bindweed. It has reniform fleshy leaves, and large rose-coloured flowers. It has been sometimes placed in the genus Calystegia. The British species are purgative; so also is the foreign *C. macrocarpus*. *C. dissectus* abounds in prussic acid, and is one of the plants used in the preparation of the liquor called noyau.

B. *Med. :* A diseased action of the muscular tissues of a greater or less portion of the body, characterized by violent muscular contractions with alternate relaxations. Such action of the muscles is, however, impossible unless nervous influence be first transmitted to them by the brain and nerves, and it is in these latter that the seat of the disease lies. As is natural, infants and young children, females, and men of the temperament called nervous, are most susceptible of convulsions. Hence one species of this genus of disease is called Infantile and another Puerperal Convulsions, the former affecting infants, the latter appearing in women towards the conclusion of pregnancy or immediately after childbirth. Convulsions have been divided into *tonic* convulsions, in which the contractions are of some duration and are not quickly succeeded by alternate relaxations, and *clonic* convulsions, in which the contraction is briefer and relaxation comes more quickly. Of the former tetanus is an example, and of the latter hysteria. Some have restricted the term convulsion to those of a tonic character. When the alternate contractions and relaxations are but slight, and very quickly succeed each other, the affection is called tremor. Convulsions specially affect the voluntary muscles, in this differing from spasm, which is applied chiefly, though not exclusively, to similar action of the muscles called involuntary. They may be local, affecting only certain muscles of the eyes, the face, the throat, the thorax, or they may be general over the body. They may be idiopathic or symptomatic of other diseases. They may arise from congestion of the brain or from its deficient nutriment, or from mechanical irritation or injury of nerves. Slight convulsions are, in many cases, unattended with danger, whilst those which are severe are dangerous in a high degree.

With regard to the passions, *cool* designates a freedom from agitation, which is a desirable quality. *Coolness* in a time of danger, and *coolness* in an argument, are alike commendable. As *cool* and *cold* respect the affections, the *cool* is opposed to the friendly, the *cold* to the warm-hearted, the *frigid* to the animated; the former is but a degree of the latter. A reception is said to be *cool*; an embrace to be *cold*; a sentiment *frigid*. *Coolness* is an enemy to social enjoyments; *coldness* is an enemy to every moral virtue; *frigidity* destroys all force of character. *Coolness* is engendered by circumstances; it supposes the previous existence of warmth; *coldness* lies often in the temperament, or is engendered by habit; it is always something vicious; *frigidity* is occasional, and is always a defect. Trifling differences produce *coolness* sometimes between the best friends: trade sometimes engenders a *cold* calculating temper in some minds: those who are remarkable for apathy will often express themselves with *frigid* indifference on the most important subjects." I. *Ordinary Language:*

1. *Of persons:* The act of labouring together with others for a common end; conjoint or concurrent labour or efforts.

". . . zealous and strenuous *cooperation*."—*Macaulay: Hist. Eng.*, ch. vi.

2. *Of things:* Concurrence in producing the same effect or in promoting the common advantage.

II. *Political Economy:*

1. *Definition:* The combined action of numbers of persons. It is of two kinds: *simple* cooperation, when several individuals help each other in the same employment, and *complex* cooperation, when they do so in different employments.

2. *Hist.:* The pioneer of cooperation in Britain and America was Robert Owen. For some details of his views and work see COMMUNISM. Though his great philanthropic projects failed, yet they suggested cooperation. Not that the idea was really new; it had been practised to a limited extent in most countries. It is a form of partnership. It may be of two kinds, cooperation in production and cooperation in distribution. During the French revolution of 1848, the Constituent Assembly voted the equivalent of £120,000 sterling to encourage cooperation, a commission being appointed to distribute the sum among workmen desirous of rising to the level of capitalists. About 300 cooperative societies at once sprung into existence, 100 of them in Paris, the rest in the provinces, all of which became extinct within twenty years, except, it is believed, about twenty. Most of the twenty, however, rose to prosperity, as did others to a larger extent which had not obtained government assistance. The movement spread to Germany, but few of the cooperative societies there are for production. The Rochdale Cotton Mill was founded in 1856, and in 1864 the Wholesale Society was established at Manchester, and that at Glasgow was founded some five years later. In 1873 the Cooperative Union was organized, and the annual production by societies connected with it is estimated at over £5,000,000. The Wholesale Society (for the two are practically one institution) has depôts in Ireland and America, and on the Continent. It possesses a small fleet of steamers, and carries on boot and shoe and cloth factories and soap works. Cooperation in distribution is designed to save the retail profits by dispensing with the middlemen. Rochdale is, as Mr. Holyoake words it, the "Mecca of cooperation." In 1844 a few flannel-weavers clubbed together their small subscriptions and founded a small cooperative store. It has risen to great prosperity, and its success has led to the establishment of a multitude of other stores of a like nature. In the United States cooperation has made less progress than in Britain, and there is nothing here to compare in importance with the famous Rochdale experiment. There has been a large development of mutual insurance, and the building and loan societies of Philadelphia form another example of cooperative action. Cooperative distribution has attained no marked success, and cooperative production still less. Profit-sharing is the nearest approach to this principle in manufacturing concerns.

2. *Law & Gram.:* A term used in the explanation of clauses doubtful in their meaning when these occur in Acts of Parliament. If two clauses are equally governed by a third one, the two are said to be coordinate to each other, or simply coordinate.

¶ *Coordinate* in this sense is opposed to *subordinate*, which is the term used when, of two clauses, one is grammatically governed by another. (*Wharton.*)

B. *As substantive:*

Geom., &c. (*Pl.*)*:* Two lines, generally at right angles to each other, employed to fix the place of any point. Thus on a globe parallels of latitude and meridians of longitude are coordinates, which, taken together, fix, with nearly mathematical accuracy, the position of any place on the globe, and would do so with perfect exactness were it a strictly geometrical figure. It is not essential that the angles made by two coordinates be right angles, though right angles are most commonly employed as most convenient for use.

¶ The reason why the term coordinate was given is that if various points in a curve be fixed by such lines the several points of the curve may be treated in order. Descartes first introduced the method of fixing the position of a point or series of points in the way just described. It is now continually in use. One division is into Rectilinear and Polar Coordinates, each of which may be in a plane or in space (that is, not in a given plane).

cŏp-aĭ′-ba, cō-paĭ′-va, ca-pĭ′-vĭ, *s.* [Fr. *copahu*; Sp. *copayba*, from Port. (Brazilian Indian?) *copaiba.*]

Pharm.: The balsam or oleo-resin obtained from incisions made in the trunk of *Copaifera multijuga* and other species of Copaifera (q.v.). Copaiba is about the consistence of olive oil, light in colour and transparent, with a peculiar odour, and an acrid aromatic taste; it is perfectly soluble in an equal volume of benzene; it does not become gelatinous when heated to 270° Fahr., and is not fluorescent. It contains a resin, Copaivic acid, and an essential oil, Copaiba oil. It dissolves one-fourth of its weight of magnesia carbonate when heated, and remains transparent; it is said that a small quantity of water contained in the balsam first combines with the magnesia, forming a hydrate which is soluble in the resin. Copaiba acts as a stimulant on the mucous membranes, especially on the genito-urinary organs. It is also a powerful diuretic.

copaiba balsam, *s.* An oily resin of an amber colour; it is used as a vehicle in oil-painting, and also as a varnish. (*Weale.*)

copaiba oil, *s.*

Chem.: A colourless transparent, mobile, peculiar smelling oil, obtained by distilling Copaiba with water, and drying over calcium chloride and rectifying. It boils at 260°. Its optical rotatory power is 34·18° to the left. It becomes brown and viscid by continued boiling. Chlorine colours it yellow-green, then blue, and then white crystals separate out. Nitric acid heated with it turns it into a resin. When distilled with calcium hypochlorite it yields chloroform. When hydrochloric acid gas is passed into copaiba oil, it precipitates a crystalline hydrochlorate, called also Hydrochlorate of Copahene or Copaivene ($C_{15}H_{24}$·3HCl), which is obtained by recrystallisation from alcohol in transparent prisms, which melt at 77°, and are insoluble in water and cold alcohol, but easily soluble in ether. A liquid substance is formed at the same time, which is called Hydrochlorate of Copahilene. It is a black viscid oil, soluble in alcohol and ether.

copaiba resin, *s.* [Copaivic acid.]

cŏp-aĭ′-fĕ-ra, *s.* [Eng. *copai(ba)*; Lat. *fero* = to bear, to produce.]

The ovary has two ovules, but the two-valved fruit is only one-seeded. Leaves alternate; pinnated leaflets, sometimes dotted. Inflorescence in axillary and terminal spikes. *C. Jacquini* or *officinalis* furnishes the West Indian Copaiva balsam. *C. Langsdorffi* and *C. coriacea*, with various other species, are said to furnish the Copaiva balsam of Brazil. *C. pubiflora* and *bracteata*, Guiana trees, furnish a very tough timber, called Purple Heart, well fitted to resist the discharges of artillery.

cŏp-aĭ′-vĭc, *a.* [Eng. *copaiv(a)*; and suff. *-ic.*]

copaivic acid, *s.*

Chem.: Also called Copahuvic acid. A crystalline resin, which exists in Copaiba balsam. It is separated by dissolving the resins which remain after the oil has been distilled off in aqueous ammonia, and leaving the solution to evaporate in a cool place. It is purified by washing with ether and re-crystallising from alcohol. Copaivic acid forms colourless rhombic crystals, soluble in strong alcohol, which are decomposed on heating. It is to have the formula $C_{20}H_{32}O_2$.

cō-păl′, *s.* [Sp. *copal*, from Mexican *copalli* = resin.]

1. *Ord. Lang. & Chem.:* A resin produced by a plant, *Rhus copallinum*, which grows in Mexico. There is a jointed tail with a tuft of bristles at its extremity. Some are found in fresh water, others are marine. Prof. Huxley says that in addition to the species placed under Copepoda by Latreille and Milne Edwards, the order contains some of the Epizoa or Ichthyophthira. ¶ (1) *Copernican hypothesis:*

Astron.: The view regarding the solar system promulgated by Copernicus, and which he was careful for ecclesiastical reasons to call a hypothesis instead of a theory. Pope Pius VII., in the early part of the nineteenth century, having promised a repeal of the Papal edict against the Copernican system, no offence was afterwards taken at Rome if the Roman Catholic professors called the Copernican views a theory, which they had not before been permitted to do, having been required to employ the term hypothesis. (*Lyell: Princip. of Geol.*, bk. i., ch. iv.)

(2) *Copernican system:*

Astron.: The system of astronomy promulgated by Copernicus, which in most of its essential features was identical with that now accepted. Previous to his time the system in vogue was the Ptolemaic one as modified by Tycho Brahe. Both of these

eminent men had placed the earth in the centre of their system, and made the sun and the planets to revolve around it. Copernicus took the great step forward of placing the sun in the centre, and reducing the earth to the comparatively humble position of a planet. The places which he assigned to the planets were essentially correct, but he failed to explain accurately the laws which regulated their movements. He supposed that they must be united to the central body — the sun — by bars, like Ptolemy's epicycles. It was not till Kepler and Newton had made two other great movements forward that the mechanism of the heavens came to be understood. There is injustice to these men when the term Copernican system is held to embrace discoveries made subsequent to the time of Copernicus. (*Prof. Airy, &c.*)

(3) *Copernican theory:*

Astron.: The theory or explanation given by Copernicus of the solar system. [Copernican hypothesis.]

Κύπρος (*kupross*) = the well-known island, which anciently had celebrated copper mines.]

A. *As substantive:*

I. *Ordinary Language:*

1. *Gen.:* The metal described under II. 1 (2).

2. *Specially:*

(1) A coin of copper—a penny, a halfpenny, or a farthing.

(2) A vessel or utensil, esp. a large vessel for cooking or washing. Such were originally of copper, but are now more frequently made of iron. In the pl. the term is applied to the large cooking boilers on board ship.

"They boiled it in a *copper* to the half."—*Bacon: Nat. Hist.*

II. *Technically:*

1. *Chem.:* A dyad metallic element. Symbol, Cu; atomic weight, 63·5; sp. gr., 8·95; melting point, 1,091° C. Copper is a red, malleable, ductile, tenacious metal, which sometimes occurs native. It does not decompose water at red heat, nor oxidise in dry air; at red heat it oxidises to a black oxide. Heated with strong sulphuric acid, So_2 is liberated

and cupric sulphate formed. It is easily dissolved by nitric acid, No_2 being given off and cupric nitrate formed. Copper forms several alloys. Brass is an alloy of two-thirds copper and one-third zinc; bronze, gun-metal, and bell-metal are alloys of copper with tin. Copper forms sets of compounds, the cuprous and cupric salts. [CUPRIC, CUPROUS, and their compounds.] Copper pyrites is a cuproso-ferric sulphide. Copper arsenite, or Scheele's green, is used as a pigment for wall papers, &c.; it is very poisonous. Compounds of copper with ammonia are known. Copper salts are detected by giving in an acid solution a black precipitate with H_2S. By giving a blue precipitate with KHO it becomes black on boiling. When a piece of clean steel is placed in a solution, copper is deposited on it. Ammonia gives a blue precipitate, which dissolves in excess, forming a dark-blue solution. Potassium ferrocyanide gives a red-brown precipitate of ferrocyanide of copper, which is soluble in ammonia, forming a blue solution. All salts of copper are poisonous. Verdigris is an acetate of copper, often formed by cooking food in copper vessels.

2. *Alchem.:* Copper was represented by the alchemists by the same sign as the planet Venus, both the metal and the goddess being associated with the island of Cyprus.

3. *Min.:* A ductile and malleable isometric mineral, often in twin crystals, with the composition face octahedral, or a double six-sided pyramid, or filiform and arborescent. Hardness, 2·5—3; sp. gr., 8—8·9 or more; colour, copper-red; streak metallic, fracture hackly. Compos.: Copper, pure or with a slight admixture of silver, bismuth, &c. It is found in beds and veins, chiefly near volcanic dykes, in serpentine, &c., or loose in the soil. It occurs abundantly in the United States, particularly in Michigan, the mines at Calumet, on Lake Superior, in that state, being the richest in the world. This country is the largest producer of copper.

¶ Antimonial Copper = Chalcostibite; three Arsenates of Copper are Trichalcite, Olivenite, and Liroconite; Arsenical Copper = Domeykite; Black Copper = Melaconite; Blue Copper = Azurite; Carbonate of Copper = Malachite; Chlorid of Copper = Atacamite and Tallingite; Chromate of Lead and Copper = Vauquelinite; Emerald Copper = Dioptase; Grey Copper = Tetrahedrite; Indigo Copper = Covellite; Muriate of Copper = Atacamite; Oxychlorid of Copper = Atacamite; Oxide of Copper, the red variety = Cuprite, the black one = Melaconite; Phosphate of Copper = (1) Libethenite, (2) Pseudomalachite; Purple Copper = Bornite; Pyritous Copper = Chalcopyrite; Red Copper = Cuprite; Selenid of Lead = Berzelianite; Selenid of Copper and Lead = Zargite; Silicate of Copper = Dioptase; Sulphate of Copper = Chalcanthite; Sulphato-chloride of Copper = Connellite; Sulphuret of Copper = (1) Chalcocite, (2) Bornite, (3) Chalcopyrite, (4) Covellite; Vanadate of Copper = Volborthite; Variegated Copper = Bornite, and Vitreous Copper = Chalcocite.

4. *Naut.:* [A. I. 1 (2).]

5. *Archæol., Hist., &c.:* Copper has been known since prehistoric times. There may have been a copper age before that of bronze. [BRONZE.] The latter compound metal, an alloy of copper and tin, was known long before brass, an alloy of copper and zinc, had been made. The word copper occurs once in the Old Testament (Ezra viii. 27), but what is in many places called brass should have been rendered copper. [BRASS.] Copper was in use in ancient Assyria. The classical nations were familiar with it. The Greeks brought it from Cyprus, the mines being at Tamassus, near Famagosta. Copper mines were first opened in England in A.D. 1189, but not very successfully till A.D. 1689.

Ecclesiol. & Ch. Hist.: The remnants of the once numerous Church of Egypt—that which had the celebrated school at Alexandria. It broke off from the body Catholic in the embracing the Monophysite doctrine, viz., that not two natures, but only one, existed in Christ [MONOPHYSITES], a view from which it has never since departed. When Jacob Baradæus formed a slightly modified Monophysite sect, most of the Egyptian Christians became Jacobites. Being tyrannised over by the Greeks, they cheerfully submitted to the Mohammedans, under Amru ben Elaas, in A.D. 638, and aided him, in 640, to take Alexandria. Since then they have been trodden under foot by the Mohammedans. About 250,000 Copts still exist in Egypt, mostly in its upper province. They have a patriarch, bishops, presbyters, archdeacons, deacons, sub-deacons, lectors, cantors, and exorcists. They have two regular convents—those of St. Anthony and St. Paul, with a number of secondary monasteries.

Theirs bore to the old Egyptian language a relation like that of the Italian to the Latin—*i.e.*, the nucleus came from the old language, but there was an increasing ingress of foreign words. It continued till the tenth century, when it was in large measure superseded by Arabic. By the seventeenth it had ceased to be spoken, and existed only as a written dialect. Whilst it lived three dialects were recognised—the Sahidic, in Upper Egypt; the Bahiric or Memphitic, in Lower Egypt; and the Bashmuric, in the Delta.

¶ Crabb thus discriminates between *copy*, *model*, *pattern*, and *specimen*: "A *copy* and a *model* may be both employed either as an original work or as a work formed after an original. In the former sense, *copy* is used in relation to impressions, manuscripts, or writings, which are made to be *copied* by the printer, the writer, or the engraver: *model* is used in every other case, whether in morality or the arts: the proof will seldom be faulty when the copy is clear and correct. There can be no good writing formed after a bad *copy*; no human being has ever presented us with a perfect *model* of virtue. In the second sense *copy* is used for painting, and *model* for relief. The *copy* ought to be faithful, the *model* ought to be just; the former should delineate exactly what is delineated by the original; the latter should adhere to the precise rules of proportion observed in the original. The pictures of Raphael do not lose their attractions even in bad *copies*: the simple *models* of antiquity often equal in value originals of modern conception. *Pattern* and *specimen* approach nearest to *model* in signification: the idea of guidance or direction is prominent in them. The *model* always serves to guide in the execution of a work; the *pattern* serves either to regulate the work, or

simply to determine the choice; the *specimen* helps only to form the opinion." (*Crabb: Eng. Synon.*)

"The temptation presents itself to those slower or careless members of the class to *copy* from their quicker class-fellows."—*Fearon: School Inspection*, p. 56.

¶ (1) Crabb thus discriminates between *to copy* and *to transcribe*: "To *copy* respects the matter; to *transcribe* respects simply the act of writing. What is *copied* must be taken immediately from the original, with which it must exactly correspond; what is *transcribed* may be taken from the *copy*, but not necessarily in an entire state. Things are *copied* for the sake of getting the contents; they are often *transcribed* for the sake of clearness and fair writing. A *copier* should be very exact; a *transcriber* should be a good writer. Lawyers *copy* deeds, and have them afterwards frequently *transcribed* as occasion requires." (*Crabb: Eng. Synon.*)

cŏp'-ў-hōld, *s. & a.* [Eng. *copy*, and *hold.*]

A. *As substantive:*

Law:

1. (See extract).

"A tenure, for which the tenant hath nothing to shew but the copy of the rolls made by the steward of his lord's court. . . . This is called a base tenure, because it holds at the will of the lord; yet not simply, but according to the custom of the manor . . . These customs of manors vary, in one point or other, almost in every manor. Some *copy-holds* are finable, and some certain: that which is finable, the lord rates at what fine or income he pleases, when the tenant is admitted into it; that which is certain, is a kind of inheritance, and called in many places customary; because the tenant dying, and the hold being void, the next of blood paying the customary fine, as two shillings for an acre, or so, cannot be denied his admission."—*Cowel.*

2. Property held by such tenure.

B. *As adjective:*

¶ Till the passing of the Act 6 Geo. IV., c. 50, § 1, copyholders were incapable of sitting on juries; and till 2 and 3 Wm. IV., c. 45, § 19 (the Reform Bill) became law, they were not allowed to vote at county elections of members of Parliament. Then those the annual value of whose copyhold was £10 obtained the privilege. Copyholds being the remains of feudal slavery, the tendency of recent legislation has been to sweep away vexatious restrictions upon the free action of copyholders, and Act 21 and 22 Vict., c. 94, which came into operation on Oct. 1, 1858, was designed to facilitate the enfranchisement of copyholds.

2. *Printing:* A clasp to hold copy while being set up; also a person who holds copy for a proof-reader.

cŏp'-ў-rĭght (*gh* silent), *s.* [Eng. *copy*, and *right.*]

Ord. Lang. & Law: The exclusive privilege possessed for a certain time by an author, his heirs or assigns, of printing, reprinting, publishing, and selling his original literary or artistic productions. In the United States authors, publishers, &c., can secure copyright for twenty-eight years; and the author, if living, or his widow or children, can then secure an extension of the copyright for fourteen years, making the final limit forty-two years. In Great Britain the first copyright law, that of 1710, fixed the time of copyright at fourteen years. In 1814 it was extended to twenty-eight years, and did not lapse then till the author's death, if he still lived. By a later act the copyright was extended to forty-two years, with the additional proviso that it should not lapse till seven years after the author's death.

International copyright has long existed between some European countries, but was not established between the United States and other countries till 1891, despite the fact that the injustice and immorality of the existing system had long been generally recognized. The existing law went into effect July 1, 1891, with the provision that its benefits must be reciprocal, and also that the work on which copyright was sought must be manufactured within the United States. This provision was adopted for the benefit of American printers, and is not acceptable to authors. International copyright now exists between the United States and several other countries, and will, no doubt, become more general.

Sometimes the mass is fifteen feet thick. Leading genera: Caryophyllia, Agaricia, and Astrea. The coral rag extends through the calcareous hills of the north-west of Berkshire and the north of Wiltshire, recurring at Scarborough in Yorkshire.

coral-reef, coral reef, *s.*

1. *Ord. Lang. & Geol.:* A reef consisting to a considerable extent, though not exclusively, of coral. The stony skeletons of zoophytes form large masses of limestone, and these, with shells, fragments of echini, &c., become cemented together by carbonate of lime, derived probably from the decomposition of dead corals. Sometimes there are masses of limestone with the very fracture of some of the secondary limestone; these could have been derived only from chemical precipitation. Mr. Darwin divides coral reefs into three kinds—(1) the annular or lagoon reef, generally called an atoll, (2) the encircling or barrier reef, and (3) the fringing or skirting reef. The first two are found only where subsidence is in progress. For the construction of the first see ATOLL. An encircling reef, that is one encircling an island at some distance from the shore, is found in an area of subsidence where the central mountain or high land has not yet disappeared beneath the ocean. Allow time enough, with the continuance meanwhile of the present conditions, and the encircling reef will become an atoll. A barrier reef—the best known example of which is one running parallel to the north-east coast of Australia for 1,000 miles, 350 of them without a break, is a portion of what, if complete, would be an encircling reef. A fringing reef, close to the shore of a volcanic island, again is produced by the elevation of the area, which converted into dry land the narrow channel by which it was at one time separated from the shore. The Dangerous and Society Archipelagoes are areas of subsidence with atolls, as, it may be presumed, is the case with the Bermuda Islands, the only specimen in the Atlantic of an atoll. The great Australian barrier reef has already been mentioned. The New Hebrides, Solomon Island, and New Ireland afford examples of fringing reefs. Slow upheaval is in progress in that portion of the Pacific.

2. *Palæont.:* The reefs of Palæozoic times, if they be worthy of the name of reefs, were built up by Rugose Corals. From the Mesozoic times till now the chief reef-builders have been the families Astreidæ, Poritidæ, and Madreporidæ, the Oculinidæ and Fungia taking a lesser share in the work. Coral reefs are evidences of the proximity of land.

¶ *Coral-reef region:* The region where reef-bearing corals live. It extends only about 1,800 miles on each side from the equator, except in the case of Bermuda, which lies in the hot waters of the Gulf Stream; 66° or more is the temperature of the sea beneath which corals will not live.

B. *Technically:*

1. *Arch. & Masonry:* The inner portion or filling of a wall.

2. *Founding:*

(1) An internal mould which forms the interior of a cylinder, tube, pipe, faucet, or other hollow casting. It is made of various proportions of new sand, loam, and horse-dung. It requires to be thoroughly dried, and when containing horse-dung must be burned to a red-heat, to consume the straw. This makes it porous and of a brick-red colour. The core is made in a core-box, and has projecting portions, known as core-prints, which rest in the prints of the mould. The model from which the object is cast is solid, and makes an impression, partly in the cope and partly in the drag. When the pattern is removed, the core is laid in its place, the projecting portions resting in the recesses made by the prints of the pattern. Touching the loam of the mould at no other point, it occupies, in the case of a pipe, a central position in the space which is to be run full of metal. When the metal has been poured around it and then cooled, the core is broken out, leaving the casting hollow. Simple cores are those which do not prevent the delivery of the cope and drag, that is, which have no undercut portion which would prevent the portions of the flask from being parted in the usual way.

II. *Scripture canon:*

St. Paul's First and Second Epistles to the Corinthians: Two well-known epistles forming part of the New Testament.

(1) *Corinth and its Church:* Corinth was a celebrated city, situated on the isthmus separating the Peloponnesus from the mainland of Greece, and with a lofty and extensive citadel, the Acrocorinthus, keeping watch over the security of the plain below. The Isthmian games were held in the vicinity. Commerce had made the city wealthy, and wealth had rendered it corrupt. Courtesans swarmed in it everywhere, and the Greek verb κορινθιάζομαι (*korinthiazomai*) meant to commit impurity of a gross kind. Some improvement had taken place since the old Greek city had given way to the Roman one founded by Julius Cæsar; but still the moral reputation of the place was low. It, however, stood high intellectually. Two visits of the Apostle paid to Corinth are described in the Acts of the Apostles. During the first of these residences in Corinth, which continued for about eighteen months, from A.D. 51 to A.D. 53, he founded the Christian Church there, the majority of the converts being Gentiles (Acts xviii. 1—18). Afterwards the eloquent Apollos took up the work (Acts xix. 1). The second recorded visit from St. Paul to Greece, doubtless including Corinth, continued three months (Acts xx. 3); but an unrecorded visit seems also to have been made (2 Cor. xii. 14, xiii. 1). There is some reason to believe that there may also have been an epistle, now lost, earlier than the two which form part of the canon (1 Cor. v. 9).

(2) *The two canonical epistles to the Corinthians:* The external and internal evidence that these two epistles emanated from St. Paul is so strong that it convinced even the sceptical mind of Dr. Ferdinand Christian Baur, who, allowing only four of the epistles attributed to St. Paul to have been really his, placed the two to the Corinthians among the four. The four were Galatians, 1 and 2 Corinthians, and Romans, and the order in which they are now given is that in which, in his view, they were issued at first. The probable date of the two epistles to the Corinthians is A.D. 57; the first having been written from Ephesus (1 Cor. xvi. 8), and the second a few months later, from Macedonia (2 Cor. i. 16, viii. 1, ix. 4, xi. 9). The subtlety of the Greek mind and other causes had produced divisions in the Church of Corinth, and four parties had arisen, one of Paul, one of Apollos, one of Cephas, and one of Christ. The first doubtless believed in the high apostolic dignity of St. Paul, and being mainly Gentile, approved of his casting off the burdensome yoke of Judaism. The party of Cephas, consisting of Judaizing Christians, depreciated the authority of St. Paul, representing his call to the apostleship as late in time and abnormal in character. The party of Apollos was probably in its essence Pauline, but with more of that wisdom of the world which Paul had ignored at Corinth (1 Cor. i. 18—24). The party of Christ may have begun by professing to rise above all sects and ended by becoming itself sectarian. Besides these parties and the lack of Christian love which they produced, there were other matters for censure. A case of incest had been discovered, yet the perpetrator of the offence had been allowed to remain in the Church. Grave irregularities had also arisen in connexion with the Holy Communion. There was serious error too in doctrine, the future resurrection of the dead being called in question by some. The Apostle in the First Epistle combats these errors with great eloquence and power. In his Second Epistle he welcomes back to the fold the now penitent delinquent whose expulsion he had counselled, and anew vindicates his apostolic authority.

A. *As substantive:*

I. *Ordinary Language:*

1. *Literally:*

(1) In the same sense as II.

(1) *Spec.:* The outer layer of bark of the Cork Oak (*Quercus Suber*). It is a very elastic tissue consisting of thin-walled nearly cubical cells. It does not peel off, but often contains long clefts. It forms a protection to the subjacent cells from injurious influences.

(2) *Gen.:* The suberous layer of the bark of other trees when greatly developed.

2. *Chem.:* Cork twice boiled with alcohol about 10 per cent. dissolved. The extract deposited Cerin, $C_{17}H_{28}O$, a white substance melting at 100°, then an amorphous acid melting at 86°, called decacrylic acid, $C_{10}HgO_2$; afterwards, on further evaporation, a fatty substance melting at 150° was deposited, called eulysin, $C_{24}H_{36}O_3$. The remainder of the liquid, evaporated to dryness, left a mass which, repeatedly boiled with water, yielded to that liquid a tannic acid, separating from the aqueous solution in dark red flocks. Its solution forms with gelatine a yellow, with tartar emetic a brown, precipitate, and reduces an ammoniacal silver solution in the cold. Potash and ammonia colour its solution red, baryta water gives a dark coloured precipitate. The calcium salt has the formula $(C_{27}H_{21}O_{17})_2Ca + 8H_2O$. The aqueous extract when further evaporated deposited a red-brown precipitate called corticic acid. The portion insoluble in water of the residue obtained by evaporating the original alcoholic extract had nearly the appearance of the original cork substance; it dissolved easily and almost completely in boiling alcohol, and partly separated on cooling as a jelly. Its alcoholic solution evaporated on paper, and penetrated the paper like fat. The portion of cork insoluble in alcohol is called suberin, which is a modified form of cellulose. Cork oxidised with nitric acid yields oxalic, suberic, and ceric acids. (*Watts: Dict. Chem.*, &c.)

Another form is a lever press with jaws.

cork-pull, *s.* A substitute for a corkscrew, having hooks or fangs which clasp a cork when in the bottle and draw it thence. The Common Cormorant has the top of the head, the neck, breast, lower parts, and rump lustrous greenish-black, a whitish collar under the throat, the feathers of the upper part of the back and wings ashy brown, bordered by a large band of glossy greenish-black; the iris is green, the feet black. Length 27—29 in. The cormorant is the κόραξ (*korax*) of Aristotle. It is found in both hemispheres. In Europe it is more frequent in the north than elsewhere. It occurs in Britain. It feeds on fishes, and with voracious appetite. It builds generally on rocky shores and islands, or more rarely on trees. Four other species of the genus are found in Europe. An Asiatic one, the Fishing Cormorant, *Phalacrocorax Sinensis*, is domesticated in China, where it is used for catching fish. According to Mr. Fortune, a string is tied round its neck to prevent it swallowing the fishes which it catches. corn-laws, *s.pl.*

Law, Polit. Econ., & Hist.: Laws designed to regulate the price of corn. Three distinct phases of opinion on the subject, each carried out by legislation, have occurred in the history of the Corn Laws:—

(1) *Period I.:* The exportation of corn was forbidden, while its importation was freely allowed. It must have been produced cheaply; had it not been so, its high price, with the expense superadded of carriage to the continent, would, without legislation, have prevented its sale there. Exportation seems to have been illegal, unless by royal licence, till the passing, in A.D. 1360–1, of the Act Edward III., c. 20, allowed grain to be sent to Calais and other special places, where it was for the advantage of the king that his corn should be forwarded. The Act 17 Richard II., c. 7, passed in 1394, gave liberty of exportation, 4 Henry VI., c. 2, limiting the permission to the times when wheat was 6s. 8d. per quarter, and barley 3s. By the Act 3 Edward IV., c. 2, passed in 1463, the importation of foreign grain was for the first time prohibited, unless when wheat exceeded 6s. 8d. per quarter, and rye 4s. There was vacillating legislation during the succeeding reigns, one phase of things being the Act 1 William and Mary, c. 12, passed in 1689, which granted a bounty on the exportation of wheat when the selling price at home was not more than 48s. per quarter, with similar bounties on other descriptions of grain. All along from the time of Queen Elizabeth, more or less of legislative interference with the free transit of grain from one part of England to another had taken place. In 1815 the bounty system was swept away, and no further interference took place with the free export of grain. Up till about A.D. 1789, England was a country which produced more grain than it needed, exporting the surplus.

(2) *Period II.:* During this period the legislature did its best, in the interest of the landowning class, to prevent the free importation of foreign grain. The first restrictive Act was in 1463 [Period I.], and existed at the same time as other Acts interfering with the export of grain. By 13 Geo. III., c. 43, passed in 1773, importation might take place upon payment of 6d. per quarter when the price of wheat rose above 48s., and the exportation when it fell to 44s. In 1791 the 48s. was raised to 54s.; the duty when wheat was between 50s. and 54s. was 2s. 6d.; and when below 50s., 24s. 3d. Other Acts followed in 1801, 1804, and 1816, till at length a sliding scale was introduced in 1828, by 9 Geo. IV., c. 38. By this enactment grain could at any time be imported on payment of a duty, diminishing as the home price of grain increased.

(3) *Period III.:* On March 15, 1838, Mr. Villiers, seconded by Mr. William Molesworth, attacked the Corn Laws in the House of Commons, but was defeated by an overwhelming majority. The same year Mr. Cobden urged the Manchester Chamber of Commerce to petition Parliament against the Corn Laws, and the Anti Corn-Law League was brought into existence, Messrs. Cobden and Bright being very prominent members. On March 12, 1839, Mr. Villiers again brought the subject before the House of Commons, losing the vote this time only by 295 to 342. A similar motion in the House of Lords failed by 24 to 224. Just before the fall of the Whig Ministry in 1841, Lord John Russell was in favour of a small fixed duty on the importation of corn, while Sir Robert Peel retained attachment to the sliding scale. A large majority (360 to 269) of the House of Commons sided with Peel, August 27, 1841, in the decisive vote which overthrew the Whig government, and on Feb. 9, 1842, he proposed a new sliding scale, which ultimately became law. [Sliding scale.] In the recess between the Parliamentary sessions of 1845 and 1846, the failure of the potato crop, and the consequent famine in Ireland, brought the subject of the Corn Laws again to the foreground. Sir Robert Peel saw that they could not longer be maintained. Men were dying of hunger, and the Corn Laws made bread artificially dear. Lord Stanley (afterwards the premier, Lord Derby) and other Conservatives could not be brought to concur with Sir Robert Peel in undertaking the necessary change. The Queen was therefore advised to send for Lord John Russell, and did so, but he failed to form a Cabinet. Sir Robert Peel therefore returned to office, and on Jan. 27, 1846, proposed a Bill abolishing the Corn Laws, which received the Royal assent on June 26, 1846. It is the Act 10 and 11 Vict., c. 46. A small remnant of duty, 1s. per quarter, left by Peel, was swept away on June 24, 1869. The working-classes of the towns may be trusted to prevent any revival of laws the effect of which would be to make their bread dearer, for the benefit of one or two classes in the community wealthier than themselves.

tendency for a bursa to arise. This sometimes deposits pus and suppurates, producing much pain. Corns may be divided into soft, which are generally situated between the toes, and hard, on more exposed parts of the foot.

¶ A bunion differs from a corn in affecting a larger part of the skin, and in always having a bursa, which as a rule inflames and suppurates.

Steam, being admitted above the piston at the commencement of the stroke, follows the piston to the point of cut-off; the remainder of the stroke is completed by the combined aid of expansion and the momentum acquired by the mass of material set in motion by the first impulse of the steam. On the completion of the stroke, the steam is allowed to pass freely from one side of the piston to the other, producing an equilibrium of effect during the out-stroke. Before the piston arrives at the point of commencement again, the equilibrium-valve is closed, shutting in a quantity of steam before it. By means of this cushioning, which is subject to the nicest adjustment, the loss from clearance and steam-ports is rendered practically nothing, if the steam so compressed be equal to the initial pressure. cŏ-rŏl'-la, *s.* [Lat. = a little crown, wreath, or garland; dimin. of *corona* = a crown, a wreath or garland.]

Bot.: The inner whorl of two series of floral envelopes, occurring in the more highly developed plants. It is situated within the outer of these envelopes called the calyx, and exteriorly to the stamens and pistils. In all cases its divisions, which are called petals, alternate with those of the calyx. They are generally coloured—*i.e.*, in botanical language, they are some other colour than green. The corolla is, as a rule, larger than the calyx, but in some plants this is not the case. When the petals of a corolla are all distinct, they are said to be polypetalous, which is the normal type of a corolla. When they cohere continuously by their margins they are generally called monopetalous (one-petalled), which is not a quite accurate term; a better one is gamopetalous, meaning that the petals have in a

certain sense contracted what may be poetically called a marriage union. For the several forms of corollas see Monopetalous, Polypetalous; see also Petal. The petals of a corolla are really only modifications of leaves. The corolla is not essential to the reproduction of a plant. It shades the productive organs inside it from injury, and, in some cases, by secreting honey attracts bees and other insects to aid in their fertilisation.

coronation stone, *s.*

Archæol. & Hist.: A stone on which the sovereign is crowned. It is fixed under the seat of the oaken coronation chair. It is a historic fact that, prior to A.D. 1296, it lay in the abbey of Scone in Perthshire, and that the Scotch had for a long period been accustomed to crown their kings upon it. In 1296, however, it was taken by Edward I., and an engagement made in 1328, in the treaty of Northampton, to give it back was not kept. It seems historic too that it had been first placed in the abbey of Scone in A.D. 805, the Scotch having brought it originally from Ireland. But when an effort is made to identify it with the stone which the patriarch Jacob rolled for a pillow at Luz or Bethel (Gen.

xxviii. 11, 18, 22) the region of myth has been reached and history left far behind.

Law: A functionary whose name *coroner*—anciently *coronator*, from Lat. *corona* = a crown—implies that he has principally to do with ¸eas of the crown or in which at least the crown is concerned. His office is very ancient, mention being made of it in A.D. 925. His court is a court of record in which, after sight of the body of one who has died in prison, or so suddenly that suspicions of violence may be excited, a jury summoned for the purpose pronounces a decision as to the cause of death. "Accidental death" is a frequent verdict, but there are cases in which it is "Wilful murder against some person or persons unknown," or an individual is named. In this the proceedings under the auspices of the coroner prepare the way for a criminal prosecution. He also officiates as a sheriff's substitute when the sheriff himself is interested in a suit, and cannot therefore act in it himself. The office is an elective one in the United States.

¶ One of the most notable cases known of corpulence was that of Daniel Lambert, who being weighed a few days before his death, in 1809, was found to be 739 lbs., or 52 st. 11 lbs. Corpulence is often constitutional, and not simply dependent on the quantity or character of the food consumed. The latter, however, have a powerful influence. In 1863 Mr. Banting published a pamphlet recommending to the over stout abstinence from sugar and substances containing much starch, a regimen which he considered had enabled him to diminish his own inordinate stoutness.

¶ Crabb thus distinguishes between *corpulent*, *stout*, and *lusty*: "*Corpulent* respects the fleshy state of the body; *stout* respects also the state of the muscles and bones: *corpulence* is therefore an incidental property; *stoutness* is a natural property: *corpulence* may come upon us according to circumstances; *stoutness* is the natural make of the body which is born with us. *Corpulence* and *lustiness* are both occasioned by the state of the health; but the former may arise from disease; the latter is always the consequence of good health; *corpulence* consists of an undue proportion of fat; *lustiness* consists of a due and full proportion of all the solids in the body." (*Crabb: Eng. Synon.*)

It was recommended in a bull issued by Pope Urban IV. between 1262 and 1264, and confirmed and enjoined by the Council of Vienne in 1311 or 1312. The French call it *la Fête-Dieu*. ¶ Crabb thus discriminates between *to correct*, *to rectify*, and *to reform*: "*Correct* respects ourselves or others; *rectify* has regard to one's self only. *Correct* is either an act of authority or discretion; *rectify* is an act of discretion only. What is *corrected* may vary in its magnitude or importance, and consequently may require more or less trouble; what is *rectified* is always of a nature to be altered without great injury or effort. Habitual or individual faults are *corrected*; individual mistakes are *rectified*. A person *corrects* himself or another of a bad habit in speaking or pronouncing; he *rectifies* any error in his accounts. Mistakes in writing must be *corrected* for the advantage of the scholar; mistakes in pecuniary transactions cannot be too soon *rectified* for the satisfaction of all parties. *Reform* like *rectify* is used only for one's self when it respects personal actions; but *reform* and *correct* are likewise employed for matters of general interest. *Correct* in neither case amounts to the same as *reform*. A person *corrects* himself of particular habits; he *reforms* his whole life: what is *corrected* undergoes a change, more or less slight; what is *reformed* assumes a new form and becomes a new thing. *Correction* is always advisable; it is the removal of an evil: *reform* is equally so as it respects a man's own conduct; but as it respects public matters, it is altogether of a questionable nature; a man cannot begin too soon to *reform* himself, nor too late to attempt *reforming* the constitutions of society. The abuses of government may always be advantageously *corrected* by the judicious hand of a wise minister: *reforms* in a state are always attended with a certain evil, and promise but an uncertain good; they are never recommended but by the young, the thoughtless, the busy, or the interested." (*Crabb: Eng. Synon.*)

A wise parent *corrects* his child; a master maintains *discipline* in his school; a general preserves *discipline* in his army. Whoever commits a fault is liable to be *punished* by those who have authority over him; if he commits a crime he subjects himself to be *punished* by law. *Correction* and *discipline* are mostly exercised by means of chastisement, for which they are often employed as a substitute; *punishment* is inflicted in any way that gives pain. *Correction* and *discipline* are both of them personal acts of authority exercised by superiors over inferiors, but the former is mostly employed by one individual over another; the latter has regard to a number who are the subjects of it directly or indirectly; *punishment* has no relation whatever to the agent by which the action is per-

formed; it may proceed alike from persons or things. A parent who spares the due *correction* of his child, or a master who does not use a proper *discipline* in his school, will alike be *punished* by the insubordination and irregularities of those over whom they have a control." Chem.: The same as Corydaline (q.v.).

cŏr-ўd'-ą-līne, †**cŏr-ўd-ą-lĭ'-ną,** *s.* [Mod. Lat. *corydalis* (q.v.), and suff. *-ine, -ina* (*Chem.*).]

Chem.: A weak organic base, $C_{18}H_{19}NO_4$. Corydaline occurs in the roots of *Corydalis bulbosa*, *C. fabacea*, and *Aristolochia cava*. The root is exhausted with water containing hydrochloric acid, the solution precipitated by sodium carbonate, the precipitate dried and treated with alcohol, and the solution allowed to crystallize. Corydaline crystallizes in colourless needles, which melt at 130°. Nitric acid converts it into a red-brown resin. Corydaline is insoluble in water, but soluble in alcohol, forming a bitter solution. Concentrated sulphuric acid dissolves it, following a dark orange solution.

cŏr-ўd'-ą-lĭs, *s.* [From Gr. κορυδαλλίς (*korudallis*) = the crested lark, the spur of which those of the fumitories somewhat resemble.]

Bot.: A genus of plants, order Fumariaceæ, tribe Fumarieæ. There are four petals, one of them gibbous and spurred at the base; the ovary has many ovules; the pod is two-valved, compressed, many-seeded, the seeds with a crest. *Corydalis claviculata*, the White Climbing Corydalis, is indigenous to Britain, especially on the walls and roofs of houses in the Highlands of Scotland. It has long, very slender, much-branched stems, pinnate leaves, the petioles ending in tendrils; the flowers small, pale yellow, almost white. *C. solida* and *lutea* are not indigenous to Britain, though they have here and there escaped from gardens. The tubers of *C. tuberosa* contain a peculiar alkali called Corydaline (q.v.). *C. bulbosa* has an aromatic tuber very bitter, and at the same time somewhat astringent and acrid. It was formerly used as a substitute for the Birthworts in expelling intestinal worms and as an emmenagogue.

Among the genera are Carpinus (Hornbeam), Corylus (Hazel), Fagus (Beech), Castanea (Chestnut), and Quercus (Oak). Found in the temperate parts of the Old and New Worlds. Southey: The Devil's Walk.

cŏs-mŏg′-ŏn-ąl, *a.* [Gr. κοσμογόνος (*kosmogonos*) = creating the world, and Eng., &c. suff. *-al.*] Relating to cosmogony, relating to the commencement of the world; cosmogonical.

cŏs-mŏg′-ŏn-ĭst, *s.* [Ger. *kosmogonist*, from Gr. κοσμογονία (*kosmogonia*).] [Cosmogony.] One who speculates on the origin of the world.

". . . *cosmogonists* were not at all restricted in building their systems to the agency of known causes."—*Lyell: Princip. of Geol.*, ch. iii.

cŏs-mŏg′-ŏn-ў, *s.* [Fr. *cosmogonie*; Sp. & Port. *cosmogonia*, all from Gr. κοσμογονία (*kosmogonia*) = the creation or origin of the world: κόσμος (*kosmos*) = order, . . . the world [Cosmos], and γόνος (*gonos*) = that which is begotten, a child, . . . a begetting; γίγνομαι (*gignomai*) = to be produced, to become; root γένω (*genō*) or γεν (*gen*), Sans. *gán.*] The origin or creation of the world; an investigation or dissertation regarding it.

¶ Cosmogony and geology, though having certain relations to each other, are still distinct, cosmogony inquiring into the first origin of things, and geology commencing at a period when, that origin having taken place, successive events in the earth's history began to leave behind them memorials from which their character might be more or less clearly reasoned out. Various epochs may be traced in its history.

(1) *Ancient Cosmogony unmodified by the Bible:* The subject more or less occupied speculative minds in most ancient countries, and a work formally named κοσμογονία (*kosmogonia*) was published by a Greek poet and philosopher, Parmenides, believed to have written about 503 B.C. A prevalent opinion among the most ancient theologians—Egyptian, Hindoo, Greek, and Roman—was that the world was created by the Supreme Being. Various philosophers, on the contrary, whose attachment to the creed of their respective countries was but nominal, believed in the eternity of the world. The acceptance of this latter tenet did not necessarily exclude belief in a Supreme Being. Thus Plato held at the same time that there was a Supreme Intelligence, and that matter was eternal. Though not created by the Supreme Being, He operated on it and fashioned it according to His will. Successive creations and catastrophes of the world were held to have occurred, and its ultimate destruction or renovation by fire was also expected.

(2) *Jewish & Christian Cosmogony:* The doctrine of the eternity of matter disappeared wherever the new phase of belief arose, for the teaching of the Old Testament was precise: "In the beginning God created the heavens and the earth" (Gen. i. 1). See also the whole of Gen. i., with Exod. xx. 11.

(3) *Jewish & Christian Cosmogony blended with independent speculation:* While geology was in its infancy, it gave its strength to cosmogonical inquiry, with the result of generating controversies which continued century after century. They were terminated, not by the settlement of the question in dispute, but by the wise resolve of those engaged in it, or at least of the higher minds among them, to confine their inquiries, at least for a time, to geological facts, and reconstruct, as far as it was practicable, the past history of the globe, before speculating as to its origin. Metaphysicians like Kant took up the abandoned field, but without notable result.

(4) *Semi-scientific Cosmogony:* Geologists have shown some tendency to return to cosmological speculation, with the aid of the vastly increased number of facts which the investigations of the last half century have accumulated. The revival of the nebular hypothesis of La Place was a return to cosmogonical speculation. [Nebular hypothesis.] The efforts made by Sir William Thomson (afterwards Lord Kelvin), Prof. Tait, and others, to ascertain by a study of the sun what fund of bygone time geologists can draw upon, also fall within the province of cosmogony.

cŏs-mŏg′-raph-ĕr, *s.* [Gr. κοσμογράφος (*kosmographos* [Cosmographic], and Eng. suff. *-er.*] One who describes the broader features of the world without descending to details; one who studies or writes on cosmography (q.v.).

"The *cosmographers*, which first discovered and described the roundness of the earth."—*Robert Bacon: Fitum Labyrinth.*, § 7.

cŏs-mŏ-grăph′-ĭc, cŏs-mŏ-grăph′-ĭc-ąl, *a.* [Fr. *cosmographique*, from Gr. κοσμογράφος (*kosmographos*) = describing the world, and Eng. suff. *-ic*, *-ical.*] Describing the world; pertaining to cosmography.

cŏs-mŏ-grăph′-ĭc-ąl-lĭ, *adv.* [Eng. *cosmographical*; *-ly.*] In a cosmographical manner; in a manner tending to describe the world.

cŏs-mŏg′-raph-ў, *s.* [Fr. *cosmographie*, from Gr. κοσμογραφία (*kosmographia*) = a description of the world: κόσμος (*kosmos*) = order, . . . the world or universe, and γραφή (*graphē*) = delineation, description.] A description of the system of the universe, or of this world, without descending to details except as these illustrate general principles. Thus a statement as to the uniform angle or direction at which the pole of the earth is slanted in every part of its orbit ought to be stated under cosmography, since it is the essential fact on which the alternation of the seasons depends; but that Ceylon is an island at the southern apex of the Indian peninsula is a mere detail properly relegated to geography. When, again, the causes of the appearances described under cosmography are investigated, the science becomes Cosmology (q.v.). These distinctions have often been ignored by writers on "cosmography," whose works in some cases have differed little from treatises on geography.

***cŏs'-mō-lābe,** *s.* [Gr. *κόσμος* (*kosmos*) = the world, and *λαβ* (*lab*), the root of *λαμβάνω* (*lambano*) = to take.]

Astron.: An instrument for taking the angles between the heavenly bodies and their height. It was called also a Pantacosm, and was nearly the same as the Astrolabe.

cŏs-mŏl'-a-try, *s.* [Gr. *κόσμος* (*kosmos*) = the world, and *λατρεία* (*latreia*) = (1) the state of a hired workman, service, servitude, (2) divine worship; *λατρεύω* (*latreuō*) = to work for hire or pay; *λάτρις* (*latris*) = a workman for hire, a hired servant.] The worship of the world. In some cases it might rest on a foundation of pantheistic belief.

cŏs-mō-lŏg'-ĭc-al, *a.* [Eng. *cosmolog(y)*; *-ical.*] Relating to cosmology (q.v.).

cŏs-mŏl'-ō-gĭst, *s.* [Eng. *cosmolog(y)*; *-ist.*] One who studies cosmology.

cŏs-mŏl'-ō-gy, *s.* [Fr. *cosmologie*; Gr. *κόσμολογία* (*kosmologia*) (*Littré*, not in *Liddell & Scott*): *κόσμος* (*kosmos*) = the world, and *λόγος* (*logos*) = . . . a discourse.] The science which investigates the causes by which the beautiful order of the universe, the solar system, or the earth has been produced, as distinct from Cosmography and Cosmogony (q.v.). Sir Charles Lyell considers Cosmology and Cosmogony identical, and they are at least closely akin. If cosmology investigates the secondary causes by which the present order of the universe is maintained, and these, as there is evidence to show, have been operative for at least an indefinite period during the past, a study of these causes is to a certain extent a study of the manner in which the genesis of the world took place.

"Cosmogony, *Cosmology*. Words synonymous in meaning, applied to speculations respecting the first origin or mode of creation of the earth . . ."—*Lyell: Princip. of Geol.*; *Glossary*

cŏs-mŏm'-ĕt-rў, *s.* [Gr. *κόσμος* (*kosmos*) = the world, and *μέτρον* (*metron*) = a measure.] The science which measures the world. But as the world in the sense of the universe is limitless, and therefore unmeasurable, it must be the earth, the solar system, or the known parts of the universe which alone can be measured or estimated.

cŏs-mō-plăs'-tĭc, *** cŏs-mō-plăs'-tĭck,** *a.* [Gr. *κόσμος* (*kosmos*) = the world, and Eng. *plastic.*] Pertaining to a plastic, spermatic, or formative principle alleged to be operative in the universe; or holding the metaphysical or cosmological tenet that such a principle was at work.

"The opinion of Seneca signifies little in this case, he being no better than a *cosmoplastick* athiest, i.e., he made a certain plastick or spermatick nature, devoid of all animality or conscious intellectuality, to be the highest principle in the universe."—*Hallywell: Melampr.* (1681), p. 84.

cŏs-mō-pŏl'-ĭ-tan, *a.* & *s.* [Gr. *κόσμος* (*kosmos*) = the world; *πολίτης* (*politēs*) = a citizen; and Eng. suff. *-an.*] [Cosmopolite.]

cŏs-mŏp'-ŏl-ĭte (Eng.), *** cŏs-mō-pō'-lĭ-tēs** (Gr.), *s.* [Gr. *κοσμοπολίτης* (*kosmopolitēs*) = a citizen of the world: *κόσμος* (*kosmos*) = the world, and *πολίτης* (*politēs*) = a citizen.] A citizen of the world; one who is cosmopolitan in feelings and character, being free from any national prejudices; one who is at home in any part of the world.

"I came tumbling out into the world a pure cadet, a true *cosmopolite*: not born to land, lease, house or office."—*Howell: Letters*, bk. i., § 6, lett. 60.

***cŏs-mō-pō-lĭt'-ĭc-al,** *a.* [Gr. *κόσμος* (*kosmos*) = the world, and Eng. *political* (q.v.).] Pertaining to or of the nature of a cosmopolite; cosmopolitan.

". . . to meditate of the *cosmopolitical* government thereof."—*Hackluyt: Voyages*, i. 6.

† cŏs-mŏp'-ō-lĭt-ĭsm, *s.* [Eng. *cosmopolit(e)*; *-ism.*] The quality of being a cosmopolite; the character of a cosmopolite; the state or condition of a citizen of the world; cosmopolitanism.

cŏs-mō-răm'-ĭc, *a.* [Eng., Mod. Gr., &c. *cosmoram(a)*, and Eng. suff. *-ic.*] Pertaining or relating to a cosmorama (q.v.).

cŏs'-mŏs, *s.* [Gr. = (1) order, (2) an ornament, (3) a ruler, (4) the world or universe from its perfect order and arrangement, as opposed to chaos. Probably from *κομέω* (*komeō*) = to take care of, to attend to.]

1. *Ancient Phil.:* The term *κόσμος* (*kosmos*) in the fourth sense [Etym.] appears first in the philosophy of Pythagoras. His followers Philolaos, Callicratidas, and others adopted the word, as did the philosophic poets Xenophanes, Parmenides, and Empedocles. From them it passed to the natural philosophers, with whom it became a current word. The Stoics used it for the *anima mundi* or soul of the world. With regard to extent it had several senses: (1) the earth, (2) the firmament, (3) the region in which the stars are fixed or apparently move; in the Alexandrian Greek, the known world. (*Liddell & Scott.*)

2. *Modern Science:* The universe, or as much of it as may be known by man. It is a sublime word, and useful when one competent for the task—if any man really is competent—attempts to sum up what is known, not of the earth merely, but of the solar system and the limitless expanse in which are the fixed stars. Thus a celebrated book in which the great naturalist Alexander von Humboldt in his old age massed together his stores of knowledge of nature, was called "Humboldt's Cosmos."

cŏs'-mō-sphere, *s.* [Gr. *κόσμος* (*kosmos*) = . . . the world, and *σφαῖρα* (*sphaira*) = a ball.]

Astronomical Instrument: An instrument for representing, though of necessity very imperfectly, the relative position of this earth with regard to the stellar "firmament." For the earth stands a terrestrial globe, for the stellar "vault" a hollow glass sphere, within which the before-mentioned globe is placed. But the firmament or vault is an infinite expanse between which and the diminutive earth there is absolute incommensurability.

cŏs-mō-thĕt'-ĭc, *a.* [Gr. *κοσμοθέτης* (*kosmothetēs*) = regulator of the world: *κόσμος* (*kosmos*) =. . . the world; *θετής* (*thetēs*) = one who places; *τίθημι* (*tithēmi*) = to place; and Eng. suff. *-ic.*]

Metaph. (*Of persons*): Believing in the existence of matter, but at the same time denying that the external world has any existence except in our own mental conception. (*Sir Wm. Hamilton.*)

Cŏs'-săck, *s.* [Russ. *kosak*; Turk. *kazâk* = a robber.] One of a race of people now forming part of Russia, and living in the south of that empire, about the river Don, &c. They form an important element in the Russian army, being used as light cavalry on account of their exceeding skill in horsemanship.

At least sixteen foreign species are known.

Entom.: A genus of Nocturnal Lepidoptera, family Hepialidæ or Ghost-moths. They have long slender half serrate antennæ, a small head, and the upper wings longer than the lower ones. The larvæ feed on wood, the pupa is enclosed in a cocoon. *Cossus ligniperda* is the Goat-moth, so called because its larvæ emit a disagreeable smell, as the goat does. It is a large moth, the expansion of its wings being about 3 in. to 3½ in.; the upper pair grey mottled with white, and having moreover black bands; the lower ones brownish ash; the body brownish grey, with silvery lines. The ground colour of the larva is yellow; it is pink above, with the head and the first segment of the body black. It takes three years to come to maturity. Though dearly to my *cost*, thy gins, and toyls."

1. (*Generally in plural*): The amount of charges incurred by the gainer in a suit, and awarded against and to be paid by the party losing.

2. *Scots Law:* Duty payable in kind, as distinguished from that paid in money.

¶ Crabb thus discriminates between *cost, expense, price,* and *charge:* "The *cost* is what a thing *costs* or occasions to be laid out; the *expense* is that which is actually laid out; the *price* is that which a thing may fetch or cause to be laid out; the *charge* is that which is required to be laid out. As a *cost* commonly comprehends an *expense*, the terms are on various occasions used indifferently for each other: we speak of counting the *cost* or counting the *expense* of doing anything; at a great *cost* or at a great *expense:* on the other hand, of venturing to do a thing to one's *cost*, of growing wise at other people's *expense.* The *cost* and the *price* have respect to the thing and its supposed value: the *expense* and the *charge* depend on the option of the persons. The *cost* of a thing must precede the *price*, and the *expense* must succeed the *charge;* we can never set a price on anything until we have ascertained what it has *cost* us; nor can we know or defray the *expense* until the *charge* be made. There may, however, frequently be a *price* where there is no *cost*, and *vice versâ;* there may also be an *expense* where there is no *charge;* but there cannot be a *charge* without an *expense. Costs* in a suit often exceed in value and amount the thing contended for: the *price* of things depends on their relative value in the eyes of others: what *costs* nothing sometimes fetches a high *price;* and other things cannot obtain a *price* equal to the first *cost. Expenses* vary with modes of living and men's desires; whoever wants much, or wants that which is not easily obtained, will have many *expenses* to defray; when the *charges* are exorbitant the *expenses* must necessarily bear a proportion. Between the epithets *costly* and *expensive* there is the same distinction. Whatever is *costly* is naturally *expensive* but not *vice versâ.*" (*Crabb: Eng. Synon.*)

No one was allowed to erect a cottage unless four acres of freehold land were attached to it; and no owner or occupier of a cottage was to allow more families than one to inhabit it. This mode is adopted in fastening a log on the sled, and generally in securing an object by a chain when the whole length of the latter is not required. So do Theophrastus and Aristobulus, one of Alexander's generals. Pliny four times mentions cotton. The Arabs had cotton goods in the time of Mohammed, about A.D. 627, and the manufacture was introduced by his followers from Africa into

Spain, whence in the fourteenth century it spread to Italy, and ultimately to the whole of Europe. It is mentioned as one of the "commoditees" imported into England by the Januays (Genoese) in the "Libel of English Policie" (1436), and even earlier in a "Compotus of Bolton Abbey," dated 1290, there is an item, "Sapo et *cotoun* ad candelam, xvij.s 1d." Cotton stuffs were first made by machinery by Louis Paul, between A.D. 1736 and 1740. They now constitute one of the leading staples of manufacture, alike in the large manufacturing cities of the United States and of England.

Columbus found the cotton-plant wild in Hispaniola, in other West India Islands, and in South America. The Mexicans were soon after found to be clothed chiefly in cotton. Cotton-seed was brought into England from the Levant, thence it was taken to the Bahama Islands, and in 1786 to Georgia. The first cotton-mill in America was erected at Beverly, Massachusetts, in 1788. The raw cotton required for the necessities of manufacture is raised in the Southern States, and converted into textile fabrics in the Northern and Southern States. The principal supply of Europe also comes from this country.

The production of cotton in the United States is over 7,000,000 bales annually; in the East Indies, 2,500,000 bales, China, 1,500,000 bales, &c. The consumption in the United States is about 3,000,000 bales; in Great Britain about 4,000,000, &c. Oil is produced from the seed.

Hist., &c.: The name given to the failure of the cotton supply to the Lancashire and other cotton-mills which took place whilst the ports of the Southern States of America were blockaded by the fleets of the North during the war between the Federals and Confederates, which continued from early in 1861 to 1865. When that great struggle began, nearly all the raw cotton required for manufacturing purposes had been supplied by America; when importation from that quarter failed, a stimulus was given to the cultivation of the cotton-plant in India and other countries. In India much cotton had from time immemorial been grown in Berar, a portion of the Nizam's dominions pledged to the Anglo-Indian government in security for a debt. One remote result of the famine has been to break the partial monopoly of cotton previously possessed by America, and increase at once the amount and the certainty of the supply.

It has the calyx cup-shaped, with five short teeth, the whole surrounded by an involucre cordate at the base, and above separating into three broad deeply-cut segments. The petals are 5; the stamens, which are many, are monadelphous; the ovary, 3–5-celled; the fruit, a 3–5-celled capsule; the seeds numerous, covered with cotton (q.v.). The genus has representatives in both hemispheres. How many species exist is difficult to determine. They have been unduly multiplied in books. Some one or other is cultivated everywhere, from the equator to 36° N., and the same of S. latitude. In the United States the species cultivated is *Gossypium barbadense*. There are two well-marked varieties: (1) The Sea-island, or Long Staple Cotton, introduced from the Bahamas in 1785, grown on the coast of Georgia and South Carolina, and on the adjacent islands; and (2) the Upland, Georgian, Bowed, or Short Staple Cotton, which grows in the Southern States generally. The former is the finer; the latter constitutes the bulk of the American cotton. Indian cotton is furnished by *G. herbaceum*. It grows in Persia, the Levant, Egypt, the south of Europe, &c. It is called Surats, from Surat, on the west coast of India, whence much of it is exported. The cotton of Brazil, Peru, and other parts of South America is derived from *G. peruvianum*. Cotton from the last two species is short staple.

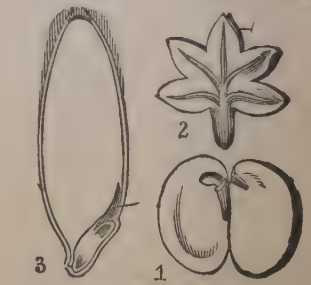
cŏt-ў-lē'-dŏn, *s.* [Lat. *cotyledon;* Gr. κοτυληδών (*kotulēdōn*) = a cup-shaped hollow, a plant, probably *Cotyledon umbilicus* (I. 1); from κοτύλη (*kotulē*) = a cup.]

I. *Botany:*

1. A genus of plants, order Crassulaceæ. Calyx, 5-partite; petals, united into a tubular or campanulate corolla; stamens ten, inserted in the tube of the corolla. *Cotyledon umbilicus* is a succulent plant with peltate, mostly radical leaves, and a simple raceme of pendulous cylindrical flowers of a yellowish-green colour. It is from six to twelve inches high, and is found in Britain on rocks, walls, and old buildings, especially in sub-alpine districts.

2. The first leaf, or one of the first two leaves, developed in a plant. In exogens two such leaves are present in the embryo of every plant, while in endogens there is one. In exogens the two cotyledons are always opposite; in endogens the second leaf developed is alternate with the first. On these distinctions or their absence have been founded three primary divisions of the Vegetable Kingdom,



COTYLEDON.

1. Pea. 2. Lime-tree.
3. Monocotyledon oat (section of seed).

viz., Dicotyledons, Monocotyledons, and Acotyledons. Sometimes, though rarely, there are more than two cotyledons: thus the Boraginaceæ and the Brassicaceæ have four, and the Coniferæ ten, twelve, or even fifteen; hence the term Polycotyledons has been used. In some cases they are absent; at other times they cohere instead of unfolding.

(2) *Cotyloid ligament:*

cŏt-ў-lŏph'-ō-ra, *s. pl.* [Gr. κοτύλη (*kotulē*) = anything hollow, a cup, &c., and φορος (*phoros*) = bearing, carrying.]

Compar. Anat. & Zool.: Mammals with cotyledonary placenta. This is found in the ruminant families Bovidæ (Oxen) and Cervidæ (Stags), while it does not exist in the Camelidæ (Camels) and the Tragulidæ (Chevrotains).

cough (pron **kof**), * **coghe,** * **coughe,** * **cowe,** * **cowghe,** *s.* & *a.* [Dut. *kuch.*] [COUGH, *v.*]

A. *As substantive:*

1. *Med. & Ord. Lang.:* A spasmodic effort, attended with noise, to expel from the air passages of the lungs some foreign body or irritating matter, which else would injure the delicate respiratory apparatus. Properly speaking it is not a disease; it is the effort of nature to remove what, if it be allowed to remain, may generate one; or it may be the symptoms of a disease of the lungs, the liver, the stomach, or the intestines; or may be produced by the over-excitability of the system in the nervous temperament. At the same time, when itself violent, it may produce morbid effects. Physiologically viewed a cough acts thus: some irritation produced by the passage through the air tubes of intensely cold air, or some other cause, affects their lining membrane, the capillary vessels of which become distended with blood. As these become thickened and tumified, the aperture for the passage of air is diminished and oppression ensues, the effect being greater if the venous rather than the arterial capillaries are the seat of the congestion. The secretion of mucus now exceeds what it would be in a state of perfect health, and the mucus itself becomes depraved in quality and is itself a fresh cause of obstruction. A cough comes to the relief of the patient. The violent expiration of air expels the matter causing the obstruction, and as the proper stimulus to the capillaries is that produced by arterial blood, this, which is always driven from the lung during expiration, removes the congestion in the capillaries, and at least temporarily relieves the system.

1 *Chem.:* $C_9H_6O_2$, or $C_6H_4<\begin{matrix}CH=CH\\|\\O—CO.\end{matrix}$

Coumarin occurs in the Tonka-bean, the fruit of *Coumarouna odorata,* in small white crystals, between the seed-coating and the kernel; also in Woodruff, *Asperula odorata,* and in the leaves and flowers of Sweet-scented Vernal Grass, *Anthoxanthum odoratum,* and other plants. It has been prepared synthetically by heating salicylic sodium aldehydes with acetic anhydride, sodium acetate being produced at the same time. Coumarin is extracted from the Tonka-bean by strong alcohol; it crystallises in colourless rectangular plates, melting at 67°. It is nearly insoluble in water, has an aromatic odour and a burning taste, and is soluble in alcohol and ether. Bromine and chlorine unite with coumarin, forming $C_9H_6O_2Br_2$ and $C_9H_6O_2Cl_2$, crystalline substances. Cold nitric acid converts coumarin into nitro-coumarin, $C_9H_5(NO_2)O_2$, but when heated converts it into picric acid. When boiled with strong caustic potash solution it is dissolved, and is reprecipitated by acids. Coumarin melted with solid caustic potash yields salicylate of potassium.

1. *Polit.:* The higher branch of the legislature in some States of America and the English colonies; generally called a legislative council.

2. *Ch. Hist.:* An ecclesiastical assembly, attended by the representatives of Churches scattered over a wide area—a province at least, but, in a large number of instances, the world—the objects of the gathering being the discussion, and if possible the settlement, of questions then agitating the Churches. Church councils, to a certain extent, are modelled upon the gathering of the Apostles and Elders at Jerusalem to discuss the question what Jewish ceremonies, if any, should be imposed upon Gentile converts to Christianity (Acts xv. 1—29). This was essentially a council, but the

technical view is that councils, properly so called, did not arise till the second century. At first they were provincial, but in the fourth general or œcumenical councils began to be held. The word œcumenical was derived from Gr. οἰκουμενικός (*oikoumenikos*), meaning of or from the whole world, and this again was from οἰκουμένη (*oikoumenē*), the inhabited world. During the time that the Church was developing itself into the form which it was destined to retain during mediæval times, seven œcumenical councils were held. The first met at Nice in A.D. 325. It condemned Arianism, and gave its sanction to the doctrine of the Trinity in Unity, which is still the creed of the Roman Catholic, of the Greek, and of the Protestant Churches. The second—that of Constantinople, A.D. 381—condemned the elder Apollinaris, or Apollinarius, and his followers, who believed that the Divine nature, in Christ, did the office of a rational human soul, and that God the Word, a sensitive soul, and a body, constituted his person. The third—that of Ephesus, A.D. 431—condemned Nestorius, who was alleged to have made Christ consist of two persons, whilst the council held that the Divine Saviour had two natures in one person. The fourth—that of Chalcedon, A.D. 451—condemned Eutyches, who maintained that there was only one nature in Christ, that of the Word, which became incarnate. The decisions of these first four councils are still accepted by nearly the whole of Christendom. Those of the fifth (the second at Constantinople, held in 553), the sixth (also at the same place, A.D. 680), and the seventh (that at Trullo, A.D. 691) have met with only partial acceptance.

The most important council of modern times, that held at Trent from A.D. 1545 to 1563, was not œcumenical, for its authority was not accepted by the Greek Church or by the Protestant reformers. It was, however, highly important, defining with precision the doctrines held by the Roman Catholic Church on all important points, and specially on those attacked by the Protestants.

A more recent council was that held at Rome in 1869 and 1870, which promulgated the infallibility of the Pope as head of the Church. Among Protestant councils may be mentioned the Pan-Anglican Synod, which met at Lambeth Palace in 1867, and was attended by Anglican bishops from England, from the Colonies, and from America. The Pan-Presbyterian Congress, which was held at Edinburgh in 1877, and a subsequent meeting in America were councils of the scattered Churches of that denomination.

These words are all employed in application to moral objects to denote the estimate which the word takes of things. To *calculate* is to look to future events and their probable consequences . . . to *compute* is to look to that which is past and what results from any past event . . . to *reckon* is either to look at that which is present and to set an estimate upon it, or to look to that which is future as something desirable . . . When used for persons, the word *couple* has relation to the marriage tie; the word *pair* to the association or the moral union: the former term is therefore more appropriate when speaking of those who are soon to be married, or have just entered that state; the latter when speaking of those who are already fixed in that state."

¶ *The courage of one's opinions:* Fearlessness in expressing one's opinions on any subject, even when unpopular or unpalatable.

¶ (1) Crabb thus discriminates between *courage, fortitude,* and *resolution:* "*Courage* respects action, *fortitude* respects passion: a man has *courage* to meet danger, and *fortitude* to endure pain. *Courage* is that power of the mind which bears up against the evil that is in prospect; *fortitude* is that power which endures the pain that is felt: the man of *courage* goes with the same coolness to the mouth of the cannon, as the man of *fortitude* undergoes the amputation of a limb. *Courage* seems to be more of a manly virtue; *fortitude* is more distinguishable as a feminine virtue: the former is at least most adapted to the male sex, who are called upon to act, and the latter to the females, who are obliged to endure: a man without *courage* would be as ill prepared to discharge his duty in his intercourse with the world, as a woman without *fortitude* would be to support herself under the complicated trials of body and mind with which she is liable to be assailed. *Resolution* is a minor species of *courage;* it is *courage* in the minor concerns of life; *courage* comprehends under it a spirit to advance; *resolution* simply marks the will not to recede . . .; *courage* always supposes some danger to be encountered: *resolution* may be exerted in merely encountering opposition and difficulty . . ." 2. *Scrip., Theol., &c.:* An engagement entered into between Jehovah and some other being or person.

(1) *Scrip.:* A vast number of passages in the Old Testament, and a few in the New, speak of covenants. There was one with Noah, as the representative, after the Deluge, of all mankind existing or who should subsequently be born: nay, as the representative also of the inferior animated creatures (Gen. vi. 18, ix. 9—17). An "everlasting covenant" was made with Abraham and his posterity (xvii. 4, 7, 9), of which circumcision was the token (10—14). It was renewed to Isaac and his posterity (xvii. 19). The covenant was in force while the Israelites were a nation. The Sabbath was part of it (Exod. xxxi. 16). The two tables of stone on which the moral law was written were tables of it (Deut. ix. 11). The priesthood entered into it (Num. xxv. 13; Neh. xiii. 29). It was renewed to David (2 Sam. xxiii. 5). Private individuals, male and female, were bound by it—departing from God they violated his covenant (Psalm l. 16; Prov. ii. 17). That covenant the Israelites broke (Jer. xxxi. 32). These are the chief of the Old Testament covenants.

In the New, the Christian dispensation is considered as a covenant (Heb. viii. 13), the covenant of promise (Eph. ii. 12), of which Jesus is the mediator (Heb. xii. 24). There is reason to believe that for Testaments, in the expression Old and New Testaments, Covenants should be substituted, and the heading of the two portions of Sacred Scripture should be The Old and New Covenants.

(2) *Theol.:* Two covenants are especially recognised by evangelical writers, the *Covenant of works* and the *Covenant of grace* (q.v.).

(3) *Ch. Hist.:* Cocceius, in the 17th century, carried the idea of Divine covenants more thoroughly than had before been done through his whole system of theology. Calvinists have done so to a greater extent than Arminians.

¶ (*a*) *Covenant of grace* or *of redemption:*

Theol.: A covenant of a twofold character: on the one hand, being between the Eternal Father and the Eternal Son, the former engaging, in consideration of the mission to earth and especially the atoning death of the Eternal Son, to grant salvation to those who should believe in the Redeemer. On the other hand, it was a covenant with men that, on their believing, they should receive eternal redemption through the blood of Christ.

(*b*) *Covenant of redemption:*

Theol.: [*Covenant of grace*].

(*c*) *Covenant of works:*

Theol.: A Divine engagement formed with Adam, the parent of our race. Its condition was, Obey and live for ever: disobey and die (Gen. ii. 16, 17). It is believed that it was made for him as representing all who should ultimately spring from him, and that his fall made them no less than him liable to death.

3. *Scottish, Ch., & Civil Hist.:* Four bonds of agreement signed by those who believed that the religious views and the political settlement which they advocated were in danger of being crushed, and therefore pledged themselves to support them notwithstanding any peril which might arise.

(1) The first covenant was signed at Edinburgh on Dec. 3, 1557, by the Earls of Argyle, Glencairn, and Morton, Archibald Lord of Lorn, John Erskine of Dun, with many of the lesser barons and influential country gentlemen. [CONGREGATION.] It was designed to aid in carrying out the Protestant Reformation in the face of all resistance which might be offered to it by the Church of Rome.

(2) The second covenant was subscribed at Perth on May 31, 1559, by the Earls of Argyle and Glencairn, Lord James Stewart, the Lords Boyd and Ochiltree, and Matthew Campbell of Terringland. Its object was the same as that of the former one.

(3) The National Covenant was signed on Feb. 28, 1638, the first name appended being that of the aged Earl of Sutherland. The covenant was signed first in Greyfriars Church, Edinburgh, and then as it lay spread out upon a tombstone in the adjacent graveyard. The people, the great majority of whom were Presbyterian, had by a vote and resolution rid themselves the year before of episcopacy, and knew that their only hope of ultimate success lay in union.

(4) The Solemn League and Covenant, written by the Rev. Alexander Henderson, accepted by the Scottish General Assembly on August 17, 1643, and subsequently by the Convention of Estates. It was then sent to London, where, on Sept. 25, it was subscribed by the English Parliament and the Westminster Assembly of Divines. It was designed to be a league between England and Scotland under the revolutionary leaders then dominant, and to establish in England no less than in Scotland the Presbyterian in lieu of the Episcopal Church.

This is the covenant most frequently alluded to by Sir Walter Scott in his novels. [COVENANTER.] When Scotland declared for Charles II. against Oliver Cromwell, the young king, previous to landing in 1650, subscribed the covenant. In 1661 the Scottish Parliament passed an Act absolving the lieges from the obligation, and prohibiting its renewal without their special warrant and approbation.

* ¶ *Writ of Covenant:*

Conveyancing: A writ which a person who was in process of purchasing land by means of a "fine" sued for as one step in the complex process. By this writ it was stated contrary to the actual fact that the vendor had covenanted to sell the lands to the purchaser, and failed to keep his agreement, on which account the writ to compel him to do so was sought. When such an action was brought, the king, by ancient prerogative, claimed a noble for every five marks of land sued for,

which came to one-tenth of the annual value. (*Blackstone : Comment.*, bk. ii., ch. 21.)

¶ The Writ of Covenant was abolished by 3 and 4 Will. IV., c. 27, § 36. (*Wharton.*)

II. *Ch. & Civil Hist.:* A subscriber of or an adherent to any of the four covenants described under COVENANT, II. 2 (1), (2), (3), and (4), and especially the last two. When the third or National Covenant was signed, it was pretty apparent that civil war would be the result of the deed, and preparations for it were made both by Charles I. and by the Covenanters. On Jan. 1, 1640, the latter took post upon Dunse Law to the number at first of 12,000, and after a little of 24,000. Next year they entered England, made a treaty with the English parliament, and aided them in the civil war against the king. On the fall of Charles they entered into the Solemn League and Covenant, designed to promote uniformity of belief both in England and Scotland on the basis of a Presbyterian establishment, but very partial success attended the scheme. Being monarchical rather than republican, they sympathised with Charles II. against the Commonwealth, and on his subscribing the covenant on August 16, 1650, fought an obstinate battle for him at Worcester on Sept. 3, 1651, which resulted in their defeat and a "crowning mercy" for their antagonist Oliver Cromwell. In 1661, when the English and Scotch nations concurred in restoring Charles II., that monarch renounced the covenant, his prior subscription to which had been insincere. Parliament declared the covenant illegal, and ordered it to be burnt. Many in consequence renounced it, or quietly allowed the fact that they had ever signed it to lapse in oblivion; but the more resolute spirits held to what they had done, and no severity on the part of the government could turn them aside from their purpose. Oftener than once they were in arms against the government. In November, 1666, they were dispersed with loss at Rullion Green in the Pentland Hills. On June 1, 1679, they defeated Claverhouse, the "Bonnie Dundee" of song, at Drumclog, but were themselves totally routed by the Earl of Monmouth at Bothwell Bridge on the 22nd of the same month and year; many of the prisoners taken being tortured and then subsequently executed. For a time the noted Richard Cameron was their leader, on which account they are often called Cameronians (q.v.). He, with about twenty others well armed, entered the little town of Sanquhar, in Dumfriesshire, on June 22, 1680, and formally proclaimed the deposition of "Charles Stuart," meaning the king, but he was killed in a skirmish at Airdsmoss, in Ayrshire, on July 20. For their subsequent history see CAMERONIANS, also REFORMED PRESBYTERIANS.

In 1044 Earl Leofric, with his wife, the lady Godiva, founded at Coventry a magnificent Benedictine monastery (*Charnock, &c.*).] The name of a town in Warwickshire.

¶ *To send any one to Coventry:* A phrase signifying to refuse to have any communication or intercourse with any one, to take no notice of him, to exclude him from society. The origin of the phrase is not very clear. Several explanations have been given, of which the most plausible is that the citizens of Coventry had, at one time, so great a dislike to soldiers, that any woman seen speaking to one was at once shut out from society, no intercourse whatever being allowed between the garrison and the townspeople: hence any soldier sent to Coventry was shut out from all social intercourse.

The ruling idea in the word *cover* is that of throwing or putting something over a body: in the word *hide* is that of keeping carefully to one's self, from the observation of others. . . . There are many things which decency as well as health require to be *covered;* and others which from their very nature must always be *hidden*. Houses must be *covered* with roofs, and bodies with clothing; the earth contains many treasures, which in all probability will always be *hidden.*" (*Crabb: Eng. Synon.*)

¶ Crabb thus discriminates between *cover*, *shelter*, and *screen*: "*Cover* is literally applied to many particular things which are employed in *covering*; but in the general sense which makes it analogous to the other terms, it includes the idea of concealing: *shelter* comprehends that of protecting from some immediate or impending evil: *screen* includes that of warding off some trouble. A *cover* always supposes something which can extend over the whole surface of a body: a *shelter* or a *screen* may merely interpose to a sufficient extent to serve the intended purpose. Military operations are sometimes carried on under *cover* of the night: a bay is a convenient *shelter* for vessels against the violence of the winds: a chair may be used as a *screen* to prevent the violent action of the heat, or the external air. In the moral sense a fair reputation is sometimes made the *cover* for the commission of gross irregularities in secret. When a person feels himself unable to withstand the attacks of his enemies, he seeks a *shelter* under the sanctity and authority of a great name. Bad men sometimes use wealth and power as a *screen* from the punishment which is due to their offences." (*Crabb: Eng. Synon.*)

II. *Theol.:* The desire for what is not one's own, whether it be money, other property, or anything else of a desirable kind. In Mahratta, *lobh* (covetousness) is often used for lust or concupiscence rather than avarice, and in some Scripture passages (as Ephes. v. 5) the meaning seems to be the same.

¶ Crabb thus discriminates between *covetousness, cupidity*, and *avarice*: "All these terms are employed to express an illicit desire after objects of gratification; but *covetousness* is applied to property in general; *cupidity* and *avarice* only to money or possessions. A child may display its *covetousness* in regard to the playthings which fall in its way; a man shows his *cupidity* in regard to the gains that fall in his way; we should therefore be careful to check the *covetous* disposition in early life, lest it show itself in the more hateful character of *cupidity* in advanced years. *Covetousness* is the natural disposition for having or getting; *cupidity* is the acquired disposition. As the love of appropriation is an innate characteristic in man, that of accumulating or wanting to accumulate, which constitutes *covetousness*, will show itself, in some persons, among the first indications of character: where the prospect of amassing great wealth is set before a man, as in the case of a governor of a distant province, it will evince great virtue in him, if his *cupidity* be not excited. The *covetous* man seeks to add to what he has; the *avaricious* man only strives to retain what he has: the *covetous* man sacrifices others to indulge himself; the *avaricious* man will sometimes sacrifice himself to indulge others; for generosity, which is opposed to *covetousness*, is sometimes associated with *avarice*." II. *Technically:*

1. *Zool.:* The female of the bovine species called the Ox, *Bos taurus*, of which the bull is the male. Like other domestic animals it has run into numerous varieties, and its primitive uniformity has given rise to manifold diversity. Nor is it in colour alone that it has altered. It has done so in form, besides which there are horned and hornless oxen. The period of gestation of the cow is nine months, and the normal number of her offspring at a birth only one. [Bos, Cattle.]

2. *Farming, Dairy Operations, &c.:* "A perfect cow," says an old writer, "should have black eyes, large clean horns, a long thin skin, a large deep belly, strong muscular thighs, round legs, broad feet, short joints, &c., white large udder with four teats." Speaking broadly this is correct; but in the choice of a cow attention should be given primarily to the nature of the pasture into which it is to be turned. The Darwinian principle of natural selection with the survival of the fittest has adapted cattle of different sizes and qualities to different parts of the country; little active Highland cattle thriving on the scanty herbage found high up the mountain-side, and large heavy slow-going cattle of luxurious proclivities falling off unless they are allowed to revel amid the rank vegetation of river-sides and meadows. The latter furnish the greatest quantity of milk. To preserve them in health, plenty of fresh air, artificial food when natural supply runs short, shelter in winter and in bad weather, and forbearance to force medicine upon them when it is not needed, are the chief requisites. Apart from breeding purposes, cows are specially kept in this country to furnish milk. For details see that word.

Medical:

† 1. *Gen.:* Any disease producing pox upon the udder or other parts of a cow. Edward Jenner discovered that there were several of these.

2. *Spec.:* That particular cutaneous disease affecting the udder of the cow, which, being transferred to the human frame, either gives an immunity from small-pox or diminishes its violence. That this is its effect had long been a popular belief among the dairy milkers in Gloucestershire, and when, prior to 1770, Jenner was an apprentice to Mr. Ludlow, an eminent surgeon at Sudbury, near Bristol, a young woman who came into the shop where he was, to ask advice, hearing small-pox mentioned, said with decision, "I cannot take that disease, for I have had cowpox." Jenner mused upon the statement, and spoke of it to scientific men, who all treated it with ridicule. Continued investigation, however, satisfied him of its truth, and about 1780 he struck out the brilliant thought that it might be practicable to propagate cowpox as a preservative against small-pox, by inoculating some human being from the cow, and from that person transferring the matter to another and another of the community till protection was obtained for all. This was the origin of vaccination (q.v.).

A. *As substantive:*

Bot.: A well-known plant, *Primula veris*, of the same genus as the Primrose, *P. vulgaris*, the Oxslip, *P. elatior*, &c. The two last are very much akin. The first and second widely differ in appearance, but statements from time to time appear that they have been found growing from the same root, in which case they would not be two species, but varieties of one. To naturalists believing in the separate creation and subsequent immutability in essential character of each species, this would be an important fact; but Darwinians would regard it as of little moment. They would probably derive the Primrose, Cowslip, Oxlip, &c., from a now extinct primulaceous plant more generalised than any of these. The Cowslip has ovate-crenate, toothed, and wrinkled leaves, with the flowers in an umbellate scape. It is common in clayey soils in England, but is rarer in Scotland. The flowers are sedative and diaphoretic. They make a pleasant soporific wine. In the United States the name Cowslip has been applied to a plant of different genus, the *Dodecatheon Meadia*, a handsome spring flower. It is sometimes called Shooting Star.

A cradle was used in very early times in crossing the Isthmus of Corinth, from the Corinthian to the Cenchrean Sea. The place was called the *Diolcos*, or drawing-place, and was five miles in length. This crossing-place was again used during the maritime warfare between the Genoese and the Turks. In its simple form, the cradle consists of three longitudinal timbers united by ribs or cross-pieces. This is floated beneath the ship, which is lashed thereto by cables. The cradle and its burden are then floated to the inclined ways or slip, up which it is hauled, being supported by rollers which intervene between the timbers of the cradle and those of the slip. (*Knight.*)

4. *Metal.:* A rocking apparatus, used in collecting gold from soil and sand by agitating the auriferous earth in water. The earth is shovelled into the sieve, and washed through its meshes by water, which also carries off the lighter earthy particles in suspension. The coarser matters, which do not pass the meshes of the sieve, are thrown out and the operation repeated. After a large quantity of earth has been thus disposed of, the contents of the cradle are washed in a pan and the gold obtained from the settlings. (*Knight.*)

5. *Engraving:* A tool used by mezzotint-engravers. It consists of a steel plate with a proper tang and handle, and has angular grooves on its under surface, so that when the rounded end is obliquely ground, it will form a row of points by which a multitude of burrs are raised upon a plate. This is the mode of proceeding in mezzotint-engraving (q.v.), the cradle being rocked backwards and forwards, and retreating, making a zigzag series of burrs. This is crossed at right angles, and then several times diagonally, until the whole surface of the plate is roughened, so as to hold the ink of the copper-plate printer. The burnisher and scraper remove the burr in parts, according to the desired graduation of lights. (*Knight.*)

crăg (4), *s.* [Provinc. Eng. *crag,* a term used in Norfolk, Suffolk, and Essex to designate masses of shelly sand used to fertilize soils deficient in calcareous matter. (*Lyell.*)]

Geol.: Three series of British beds, all of Pleiocene age; the uppermost, the Norwich Crag, being newer, and the Red Crag and White or Coralline Crag being older Pleiocene. Of the latter age is a series of foreign beds called Antwerp Crag. The following series is in a descending order:

1. *The Norwich, Fluvio-Marine,* or *Mammaliferous Crag:* The first name is given because it is found chiefly in the neighbourhood of Norwich. It consists of incoherent sand, loam, and gravel, exposed on both sides of the Yare. These must have been deposited originally in an estuary; for the organic remains are partly land, partly fluviatile, and partly marine. Characteristic mammalian remains are the *Mastodon arvernensis* and the *Elephas meridionalis.* Of 124 marine shells, Mr. Searles Wood considers that 18 are extinct. Arctic shells are rarer than in the beds above.

2. *The Red Crag of Suffolk and Essex, &c.:* It is the highest of the older Pleiocene strata. It rarely exceeds 20 ft. in thickness. Excluding 25 species of molluscs derived from other beds, there are, according to Mr. Searles Wood, 256 known species of shells in the Red Crag, of which 65 or 25 per cent. are extinct.

3. *The White, Lower* or *Coralline Crag:* It is limited in extent, ranging only about 20 in. in length by 3 in. or 4 in. in breadth, between the rivers Stour and Alde in Suffolk. It is calcareous in composition, often consisting of comminuted shells and remains of bryozoa. From the abundance of the latter it is called Coralline Crag, but this is somewhat of a misnomer, for bryozoa are not real corals. Mr. Searles Wood considers that 350 species of mollusca have been found in it, of which 110, or 31 per cent., seem to be extinct.

¶ Corresponding in age to 2 and 3 is the Antwerp Crag, found near the city after which it is called and along the Scheldt.

4. *The Black Crag:* The lowest part of the Antwerp Crag, more ancient than any of the British crag beds, and approaching the point of junction with the Upper Miocene. (*Lyell.*)

(1) *Sing. :* Any bird of the genus Grus, or the family Gruidæ (q.v.). The Common Crane is *Grus cinerea*. The tip of the bill is horn-coloured, its middle part greenish-black, the base reddish. The top of the head, which is naked, is of a red colour; the plumage in general is an ashy grey; the throat, neck, and occiput darker; the feet black—length 3 feet 8 in. to 3 feet 10 in. It is a grallatorial bird, frequenting marshes, but has certain affinities to the Rasores. It is a migratory bird, in winter living in India, Egypt, and other warm countries of the old world, and in summer migrating to the north. In these passages it flies, generally by night, high in air, in a large wedge-formed flock, led by a single leader, or in long lines, and with discordant cries. These movements attracted the notice of the ancient classic writers. The crane was once common in the fenny parts of England, now it is rare. Where it breeds, which is in the north of Europe and Siberia, the nest is among rushes, or even on the walls of unfrequented houses. B. *Technically:*

1. *Machinery:*

(1) An arm (called the web) at right angles to an axis, by which motion is imparted thereto or received therefrom. The crank on the axis of a grindstone or a fanning-mill is a familiar instance. The crank is also a valued device in converting a rotary into a reciprocating motion, or conversely. An example of the former is found in the saw-mill; of the latter, in the steam-engine. Watt is the inventor of the latter application of it. The crank was first used in connection with steam-navigation by William Symington, in 1802, on his second steam-boat, the "Charlotte Dundas." The crank was fixed on the paddle-shaft of the stern-wheel which impelled the vessel, and was worked from the piston-rod by means of a connecting-rod. Since then the crank has superseded the sun-and-planet wheel motion and all other devices for producing rotary motion in the steam-engine. The bell-crank, so called from its frequent use in bell-hanging, is only used to change the direction of a reciprocating motion. A two-throw or three-throw crank-shaft is one having so many cranks set at different angles on the shaft.

(2) A contrivance used for labour in prisons, consisting of a small wheel, like the paddle-wheel of a steamer, which the prisoner has to turn with a handle in a box more or less filled with gravel.

crā'-tẽr, *s.* [Lat. *crater*; Gr. *κρατήρ* (*kratēr*) = a mixing vessel ... a large bowl ... any cup-shaped hollow ... the mouth of a volcano.]

1. *Class. Archæol.:* A large bowl. [*Etym.*]

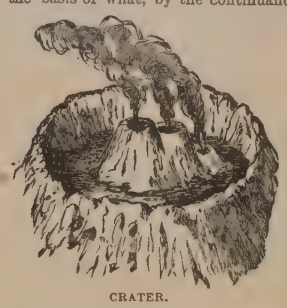
2. *Geol. & Ord. Lang.:* The basin-like, circular opening, generally at the apex of a volcanic cone, from which eruption takes place. It is formed in the following way. A chasm or fissure opens in the earth, from which great volumes of steam and other gases are evolved. Shattered lava, fragments of broken stone, sand, &c., follow; and, falling in heaps, lay the basis of what, by the continuance of



CRATER.

the same process, will ultimately become a volcanic cone. The movement upwards of steam and other gases keeps open a passage from beneath to the apex of the cone. This passage is the crater. The efflux of lava may ultimately consolidate it, or it may produce the contrary effect and break it down. There may be many cones and many craters, or one large volcano, and escape of gases may be by long fissures instead of by cup-shaped craters. (*Lyell, &c.*)

It was held by Von Buch, Elie de Beaumont, and others; but is now generally abandoned, the rival theory of Lyell and others being that the beds in question have been formed by the descent of materials ejected into the air by successive eruptions, and arranging themselves at or about the angle at which we now find them as they fell.

crē′-ąt-ĭne, *s.* [Ger. *kreatin*, from Gr. κρέας (*kreas*), genit. κρέατος (*kreatos*) = flesh, and suff. *-ine* (*Chem.*).]

Chem.: Methyl-glycocyamine. Methyl-guanido-acetic acid, $C_4H_9N_3O_2 + H_2O$, or $HN{=}C{<}^{NH_2}_{N(CH_3)-CH_2-CO\cdot OH}$. Creatine is obtained from the muscular flesh of mammalia, birds, reptiles, and fishes. It has been found in the blood and urine, and in the brains of pigeons and dogs. It is obtained by chopping up the lean muscular flesh, removing the fat, and rubbing it with water and pressing it; the liquid is heated in a water-bath to coagulate the albumen, then strained; to the filtrate baryta-water is added so long as it gives a precipitate, the filtrate concentrated on a water-bath, the crystals, which separate, decolorised by animal charcoal and re-crystallised from water. Creatine crystallises in rhombic needles containing one molecule of water, which is driven off at 100°. The water solution has a bitter taste, and is neutral to litmus. It gives a white precipitate with silver nitrate, which is soluble in potash. After a time the solution solidifies to a transparent gelatinous mass, which is reduced when heated. Creatine heated gives off ammonia and hydrocyanic acid. Creatine is dissolved by strong acids; it loses a molecule of water, and is converted into Creatinine. By boiling with baryta-water creatine is decomposed, yielding sarcosine, methyl glycocine, $C_3H_7NO_2$ + urea $CO{<}^{NH_2}_{NH_2}$. Creatine has been formed synthetically by heating cyanamide, $C{\equiv}N$, $H_2{<}^{NH\cdot CH_3}_{CO\cdot OH}$, with sarcosine, $CH_2{<}^{NH}_{CO}$, in an alcoholic solution to 100° for some hours; or leaving a mixed aqueous solution to evaporate, the creatine separates out in crystals. Creatine heated to redness with soda-lime in a tube, yields NH_3 and methylamine, $NH_2{\cdot}CH_3$.

C. *As subst.:* The act of giving existence or being to; production, creation.

That God can only exist in *creating*."
Longfellow: The Golden Legend, vi.

crē-ăt′-ĭn-ine, *s.* [Eng. *creatin(e)*; suff. *-ine.* In Ger. *kreatinin.*]

Chem.: Methyl-glycocyamidine, $C_4H_7N_3O$, or $HN{=}C{<}^{NH\ -\ CO}_{N(CH_3)-CH_2}$. Creatinine occurs in urine and in muscular flesh; it is found in the mother liquid formed in the preparation of creatine. It can be prepared by the action of strong acids on creatine, also by evaporating, below 100°, fresh urine neutralised with carbonate of sodium to a syrup. The syrup is exhausted by alcohol, and the filtrate is mixed with a concentrated alcoholic solution of zinc chloride; the precipitate, after standing some time, is washed and boiled with water; the filtrate is evaporated; the crystals are dissolved in hot water and purified by recrystallisation; the solution in boiling water is then digested with hydrated lead oxide, filtered from the oxide of zinc and oxychloride of lead, purified by blood charcoal; strong alcohol dissolves the creatinine and leaves the creatine. Creatinine forms colourless prisms, very soluble in water and in alcohol; a concentrated solution has an alkaline taste, reddens turmeric, and turns red litmus blue. It is a strong base. Creatinine concentrated solution gives a ruby-red colour, when made slightly alkaline with potash and nitro-prusside of sodium is added. Creatinine forms salts with acids. (*Watts: Dict. Chem.*, &c.)

1. The act of creating, or of calling into existence out of nothing.

"The mind finds no great difficulty, to distinguish the several originals of things into two sorts: First, When the thing is wholly made new, so that no part thereof did ever exist before; as when a new particle of matter doth begin to exist, *in rerum naturâ*, which had before no being; and this we call *creation*."—*Locke: Hum. Underst.*, bk. ii., ch. xxvi.

¶ (1) *Centre* or *Centres of Creation:*

(*a*) *Sing.* (*Centre* or *focus of Creation*): A point or place on the earth's surface where it is assumed that a certain individual species was created, and whence it is supposed that it diffused itself to the various regions in which it now is found.

(*b*) *Pl.* (*Centres* or *foci of Creation*): Certain spots on the earth's surface where not one but

various, or perhaps even many species may have been created, and whence they may have been disseminated. The Darwinians would object to the use of the word creation in connection with "the origin of species," but admit centres or foci where they have come into being.

(2) *Date, era,* or *epoch of the Creation:* There are about 140 opinions professedly founded on calculations made from Scripture with respect to the era of the Creation. The highest date given is B.C. 6984, the lowest 3616, a difference of 3,368 years. One chief reason of the discrepancy is the fact that the Hebrew and the Septuagint chronologies of Genesis v., and some other parts of the same book, differ widely, and there may be difference of opinion as to which has been changed. [CHRONOLOGY.] The geologist draws a wide distinction between the date when man first came into being and that at which the world was produced. The first is a very recent event, if marked on the scale of geological time, but a very remote one as compared with the date assigned by those who have made their calculations solely from the Hebrew or the Greek Septuagint numbers. [ANTIQUITY OF MAN.] Various Christian harmonists have attempted to reconcile Scripture and science in this and other respects. [HARMONY.]

(3) *The hypothesis of successive creations:* The view was held by Murchison and many others that successive creations have taken place, each an advance on its predecessor.

"These views of the *successive creation* of different races are, it is true, mainly based upon the progressive rise in the scale of the vertebrate sub-kingdom."—*Murchison: Siluria,* ch. xviii.
